Clearly reflects the philosophy of the team approach by including contributions from a pediatric orthopedist, pediatric general surgeons and several pediatric physical therapists. Reviews the differential diagnosis and surgical management of CMT and provides a detailed, comprehensive approach to the nonoperative management of CMT by bringing together a wide range of related materials under one cover.

KP3171DS **$24.95**

Easy for You to Say
Miriam Kaufman, MD
Q & As for Teens Living With Chronic Illness or Disability

This book addresses issues faced by teens and young adults with disabilities and chronic conditions. The information is presented in a straightforward questions and answer format that can easily be browsed through, rather than read cover to cover. Divided into eight chapters to enable the reader to jump to a topic of interest such as Doctors and Medical Issues; Friends and Dating or Sexuality plus much more.

KP6194CI **$15.95**

BEHAVIOR

The Anti-Bullying Handbook
Keith Sullivan

Written for Parents, teachers, administrators, counselors, therapists this resource can help us to understand what bullying is and how to arrest it or to prevent it. Part I gives a clear overview of what we understand about bullying and Part II provides information on how to deal with with bullying.

OU3884BE **$19.95**

Raising Children Who Refuse to Be Raised
Dave Ziegler, Ph.D.

This book is for both parents and professionals who are involved with the care of children who have severe emotional or behavioral disturbances as the result of abuse or neglect. The three major sections cover: Emotional disturbances, Where it all Begins; Behavioral Disturbances. There is More than Meets the Eye; and lastly Advanced parenting Skills and Challenges. The 12 chapters contain detailed discussions of emotional or behavioral disorders, their causes and possibilities for treatment.

AC8777BH **$19.99**

ASPERGER SYNDROME

Blue Bottle Mystery
Kathy Hoopmann

A warm, funfilled fantasy story that enables children with Asperger syndrome to read about their disability in a non threatening way that promotes the best in them.

TT9785 **$11.95**

Asperger Syndrome, the Universe, and Everything
Kenneth Hall

The author was diagnosed with Asperger Syndrome at age eight, and now he describes some of the inner experiences and perceptions a child with autism has from a unique perspective that only one who has been through it can truly explain.

TT9300AS **$11.95**

Of Mice and Aliens
An Asperger Adventure
Kathy Hoopmann

Ben, recently diagnosed with Asperger Syndrome, and his friend Andy uncover an alien spaceship that crash landed in their backyard. With Ben trying to cope with his disorder, and the alien trying to cope with life on earth, adventure ensues.

TT0073AS **$11.95**

SPINA BIFIDA

An Introduction To Spina Bifida
David G. McLone, M.D., Ph.D. and Joy Ito, R.N.

The purpose of this book is to aid the parents, family and non-medical people who care for the child born with spina bifida. Revised 1998

SB0955B **$6.00**

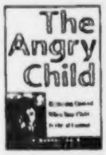
Answering Your Questions About Spina Bifida
A Guide from the Spina Bifida Program Department of General Pediatrics
Edited by C. Shaer

Available in Spanish

Contains information to help understand basic medical, educational, and social issues of children and adults with spina bifida.

CN1525B-ENGLISH **$6.95**
CN1535B-SPANISH **$6.95**

PARENTING



The Angry Child
Regaining Control When Your Child is Out of Control
Tim Murphy, Ph.D.

Anger can be a normal response to frustration or disappointment, but for some children it is an ingrained behavior that caused them and those around them needless misery. This book provides both the roots and the solutions for uncontrollable anger in children. Learn the 10 characteristics of the angry child, Four stages of anger and how to cope, the 5 C's of successful parenting and much more.

RH676XPA **$24.00**

Father Need
Why Father Care Is as Essential as Mother Care for Your Child
Kyle D. Pruett, M.D.

An easy to follow handbook which offers in depth advice for parenting children of all age groups from infancy through adolescence and adulthood. Learn not only why a father needs to take an active role in raising children, but also how to do so effectively.

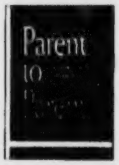
SPECIAL KIDS NEED SPECIAL PARENTS
A Resource for Parents of Children with Special Needs
JUDITH LOSEFF LAVIN

Parents of children with special needs face unique emotional and practical challenges every day. These issues are seldom fully addressed by the medical community—an parents' most compelling questions remain unanswered. The author draws upon interviews with health care professionals, nationally recognized authorities and families of special need children to give readers the advice, encouragement and comfort they crave.

GP6622PA **$13.95**

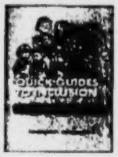


THE PARENT TO PARENT HANDBOOK
Connecting Families of Children with Special Needs
BETSY SANTELLI, FLORENE STEWARD POYADUE, JANE LEORA YOUNG

As a parent you have lots of questions, If you child has a disability you probably have even more. One of the best ways to find answers to your questions is through "Parent to Parent Programs". Written by two mothers that have been there this book will explain how these valuable programs work and how they can give you the help you need.

PB4979GN **$29.95**

INCLUSION



QUICK GUIDES TO INCLUSION
Ideas for Educating Students with Disabilities
MICHAEL F. GIANGRECO

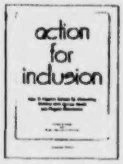
With brief factual summaries and to the point suggestions, the book is easy to use and focused on the topics most essential to successful inclusion. An entry level guidebook for new teachers and a concise summary of practices for seasoned professionals.

PB143ED **$22.95**

THE ILLUSION OF FULL INCLUSION
A Comprehensive Critique of a Current Special
JAMES M. KAUFFMAN AND DANIEL P. HALLAHAN

A collection of analyses by nationally recognized individuals who raise serious questions about the full inclusion of all students with disabilities into general education.

PE178IN **$31.00**



ACTION FOR INCLUSION
How to Improve Schools By Welcoming Children with Special Needs Into Regular Classrooms
O'BRIEN AND FOREST WITH SNOW, PEARPOINT, AND HASBURY

An extraordinary plain language guide to inclusion. Provides a clear presentation of the values behind full inclusion and outlines a sensible series of actions that can be followed to make full inclusion a reality.

IP700ED **$15.00**

AUTISM

THROUGH THE EYES OF ALIENS
A Book About Autistic People
JASMINE LEE O'NEIL

This is a rich and positive description of how it feels to be autistic and how friends, family and the professionals that work with autistic people can be more sensitive to their needs. Written with a creative spin by an author who is autistic herself.

TF009AT **$24.95**

EXITING NIRVANA
A Daughter's Life with Autism
CLARA CLAIBORNE PARK

The sequel to "The Siege", this book finds Jessy Park, now an adult, still struggling with language, with hypersensitivity's and obsessions, and with the social interactions that ordinary people take for granted but she cannot understand. With the help of family, teachers, and friends, Jessy has achieved more than her parents could have hoped for. This is a moving story about the making of a self and what it means to be human and a contributing active member of her family and community.

LB1178AT **$23.95**

REACHING OUT, JOINING IN
Teaching Social Skills to Young Children with Autism
MARY JANE WEISS, PH.D., BCBA & SANDRA L. HARRIS PH.D.

Designed to show parents and professionals how to help young children with Autism with one of their most challenging areas of development—Social behavior this book covers four broad topics. This book focuses on the following areas: play skills; the language of social skills; understanding another person's perspective; and using these skills in an inclusive classroom. This guide offers invaluable expertise and easy to understand activities parents and teachers can practice at home or at school to help kids with autism in preschool through elementary schools become more socially adept.

WB7240AT **$16.95**

SON RISE
The Miracle Continues
BARRY NEIL KAUFMAN

An inspiring journal of a family's successful effort to reach their autistic child. Includes stories of other families who have used the same approach to heal their special children.

OI085AM **$20.00**

AUTISM THROUGH THE LIFESPAN
The Eden Model
DAVID L. HOLMES, ED.D.

A unique and detailed look at a successful approach to treating and caring for children with autism. Parents, teachers, and treatment professionals will find this book to be informative and insightful reading.

I could have diabetes and not even know it?

Then why would I want to know?

Diabetes can lead to heart disease, stroke, kidney disease, amputations and blindness! What's scary is that there are often no symptoms.

If you're over forty-five, you don't exercise, and you're overweight, you're at risk!

What should you do? Get a simple blood test. Because with early detection and treatment, diabetes can be kept under control.

PART X

The Use of Sedation for the DENTAL PATIENT WITH SPECIAL NEEDS

by Nancy Dougherty, DMD, Maureen Romer, DDS, MPA and Steven P. Perlman, DDS, MScD

Before your child is scheduled for a sedative procedure in a dental office, make sure that the practitioner has the appropriate certification required by your state for the type of sedation to be administered.

There are various indications for the use of sedation in dental patients with disabilities. These can include: patients who are unable to cooperate because of extreme anxiety or phobia concerning dental treatment; individuals who exhibit involuntary movement caused by neuromuscular disorders; and patients who, due to mental retardation, are unable to understand the need for dental care and are unable to cooperate in a way that allows the dental professional to provide optimal care. Additionally, some patients capable of cooperating for brief, minor procedures may require sedation for more extensive treatment needs. The decision to utilize a sedative medication should be made only after a thorough evaluation of dental treatment needs has been completed, a level of patient cooperation has been attained and the patient's current health status assessed.

Dental professionals are trained in a number of sedative techniques that can alleviate patient anxiety and/or control disruptive behaviors in the course of dental treatment. Laws regulating sedative administration by dentists vary widely from state to state. Before your child is scheduled for a sedative procedure in a dental office, make sure that the practitioner has the appropriate certification required by your state for the type of sedation to be administered. It is very important that you completely familiarize the doctor with your child's medical history and provide information on any medications your child may be taking.

Sedative techniques run along a continuum from light, conscious sedation, through unconscious sedation, all the way to general anesthesia. The degree of sedation is dependent upon the drugs utilized as well as the dosage and route of drug administration.

Types of Sedation

Inhalation: The combination of nitrous oxide and oxygen (commonly known as "laughing gas") is the most commonly employed sedative agent in dentistry. As used in dental offices today, nitrous oxide is not a particularly potent sedative. It is, however, highly effective in inducing relaxation in patients with anxiety. One of the biggest advantages of nitrous oxide is its relative safety compared to most other sedative agents. Its rapid onset of action and short recovery time also contribute to nitrous oxide's value as a conscious sedative agent. In fact, complete recovery from

continued on page 114

continued from page 113

the effects of nitrous oxide usually occurs within three to five minutes of pure oxygen inhalation. A drawback to the administration of nitrous oxide is that the procedure requires a degree of patient cooperation. Since the patient must be willing to wear a nasal hood and understand the need to breathe through the nose in order for the drug to be effective, the procedure will probably be ineffective with individuals with extremely disruptive behavior or those with significant cognitive deficits. Nitrous oxide sedation can also induce nausea and vomiting in some patients. Because of this, it is advised that patients not eat prior to receiving nitrous oxide.

Oral: Most pediatric dentists are trained in the use of some oral sedative medications and many practitioners utilize them. The oral sedative most frequently used by pediatric dentists is midazolam. Other oral sedatives commonly encountered in dentistry are *chloral hydrate, hydroxyzine* and *diazepam*. All of these medications are considered conscious sedative agents and, in most cases, the patient will remain awake during the dental procedure.

Some practitioners may use combinations of oral medications to enhance the sedative effect. These oral medications may also be used in combination with nitrous oxide sedation and/or physical restraint. The major advantage of oral medication is the ease of administration. The only patient cooperation required is the willingness to swallow medication. Disadvantages include a fairly slow onset of action (at least 30 minutes) and variable levels of effectiveness from patient to patient. Patient anxiety level, metabolism and rate of absorption through the stomach can all have an impact on the duration of action and effectiveness of oral sedative medications; a dosage that provides adequate sedation for one individual may be ineffective in another person the same age and size. An additional disadvantage to oral sedatives is the inability to quickly reverse the action of the drug.

Intramuscular (IM): Intramuscular injection of sedative medication is another technique used in some dental offices. It involves the injection of medication into areas of high muscle mass, usually the upper arm, buttock or thigh. IM administration has several advantages over orally administered medication. It has a more rapid onset of action and more reliable absorption than the oral route. It can also be useful for a patient who is resistant to swallowing medications. However, the IM and oral routes of sedative administration share many disadvantages. As with oral administration, it is impossible to predict on a consistent basis the most effective dose of injected sedative for each patient. The inability to quickly reverse the action of a drug injected intramuscularly is another shortcoming. IM sedation can be useful for fairly brief procedures or as a premedication for disruptive patients to allow subsequent placement of an intravenous (IV) line. *Ketamine* is one of the medications frequently used for IM sedation.

Intravenous (IV): IV sedation is used primarily by oral surgeons and, to a lesser extent, by general and pediatric dentists trained in the technique. In some instances, a specialist in dental anesthesia will perform the sedation and monitor its performance. IV sedation has a rapid onset of action and, in most cases, is very effective. Because the patient has an IV in place throughout the procedure, additional medication can be administered as needed. The level of sedation can thus be better controlled than with the oral or IM techniques, and also permits the completion of lengthier procedures. Emergency drugs can also be administered through the IV if necessary.

The major disadvantage to IV sedation is that the patient must be cooperative during venipuncture (insertion of the needle into a vein). This may be difficult to accomplish with either young, fearful children or patients with resistant behavior. Several different medications are available for use as IV sedatives. The practitioner will determine which drug is the most appropriate for each patient based on factors such as the length of the anticipated procedure and the patient's medical status.

For many patients, in-office sedation may be more desirable than general anesthesia performed in the hospital because it is more cost-effective. However, it may be difficult to find dental practitioners who are trained and certified to perform sedation in their offices. Also, some individuals who have extensive treatment needs or medical compromises may be more appropriately treated in the very controlled environment of a hospital operating room.

Hospital Dentistry

General Anesthetia: If the child or adult patient cannot be treated safely and effectively in the office environment by utilizing the previously discussed techniques, the alternative would be treatment in the hospital operating room under general anesthesia. The criteria clinicians use in making the decision to treat a patient under these circumstances will vary greatly depending on their level of skill and treatment philosophy. The utilization of either physical or mechanical restraint, or premedication and sedation, should be satisfactory to treat the vast majority of patients with special needs. Only for a limited number of cases under specific circumstances should general anesthesia be considered as a preferred alternative in the delivery of care.

For general anesthesia to be considered, a thorough patient examination must be completed so that the clinician is completely prepared to face any situation that may arise in the operating room. No matter how much restraint is necessary or how difficult it is to obtain, a thorough examination must be completed with even the most resistant, non-compliant, uncooperative patient.

If the decision to utilize general anesthesia is made to improve behavior management, there must be attempts to accomplish the dentistry with or without restraint. The decision for hospitalization is usually based on the amount of required dentistry and the patient's level of cooperation and medical condition.

In hospitalizing an infant or a child needing dental care, age alone should not be the deciding factor. Most infants and children can be safely and effectively treated in the office by a variety of techniques. Medical conditions beyond a patient's disability that may contribute to the need for hospitalization include cardiac or respiratory issues or, perhaps, a severe neurological disorder.

In addition to these criteria for children, adolescents may present behavioral issues that the clinician may not be able to manage because of their patient's physical stature (i.e., height and weight). The amount of necessary dental care is not a factor if the patient can be safely treated with multiple visits.

The decision for hospitalization is usually based on the amount of required dentistry and the patient's level of cooperation and medical condition.

Adult patients may have the following dental needs: severe periodontal (gum) disease requiring surgery; problems with wisdom teeth, including impactions requiring complicated oral surgery; or the need for a significant amount of restorative dentistry (fillings).

Behavior management and the inability to perform these procedures under any other circumstances are indications for general anesthesia. The same criteria would hold true for the geriatric patient with special needs.

If the clinician decides that general anesthesia is the only viable alternative for care delivery, then the first step is for the dental staff to consult with the primary care physician. Two important questions must also be answered. The first question is whether or not the patient is medically competent to undergo the procedure. The second is whether hospitalization will permit medical personnel to perform additional tests that the patient's inability to cooperate would otherwise prevent.

Virtually any medical procedure can be accomplished in addition to the dental rehabilitation. Any type of blood test can be done and drug levels can be checked to determine if they are within normal limits. Any type of examination, including gynecological, gastroenterological, visual and auditory examinations, can be done. Radiographs can be obtained and ultrasound procedures can be performed. Minor surgical and/or plastic surgery also can be performed.

When the patient is under general anesthesia, a four-, five- or even six-hour procedure is not uncommon. The key is to utilize the opportunity to complete as many necessary medical and dental procedures as possible.

In addition to the medical personnel, dental specialists may be part of the operating team. This may include oral surgeons, endodontists (root canal specialists), periodontists (gum), prosthodontists (crown and bridge) or pediatric specialists. Pediatric dentists are often the primary health provider for adults with disabilities due to the nature of our health care delivery system.

Once the plan for the dental rehabilitation is established, the case can be scheduled and usually done in the hospital's surgical day care facility. Surgical day care centers are designed for patients to be discharged the same day following sufficient time in the recovery room and post-op areas. When patients are alert, have voided, are afebrile (do not have a fever) and tolerate clear fluids, they can then be discharged to their families or caregivers.

Another factor that must be considered in the overall treatment plan is cost. Hospital dentistry is very expensive and a case that lasts several hours can cost between $4,000 and $12,000, not counting any of the fees for medical or dental procedures. That figure only covers operating room time, anesthesia fees, recovery room and postoperative care. These cases all require preauthorization from either private insurance or Medicaid programs.

Another important issue is that legal consent must be obtained prior to hospitalization. If the patient is his or her own legal guardian, or if a family member or caregiver is guardian, this is not a problem. However, there may be a court-appointed legal guardian who is not readily accessible. In any event, proper legal consent must be obtained.

It must also be realized that before general anesthesia is administered, a proper blood work-up and a chest radiograph (X-ray) are necessary and customary. For patients with behavioral considerations, these important diagnostic pretests may be impossible to obtain, and so present a risk. Therefore, not every hospital or medical staff may be willing to accept these dental rehabilitation cases.

In summary, oral rehabilitation under general anesthesia is an important and, quite possibly, the only viable option to deliver safe, quality and comprehensive dental care for the exceptional patient with special needs. **EP**

SSI and Employment Opportunities for Young Adults with Retardation: Safety Net or Bungee Cord?

by Jan Blacher, PhD

April seems like an appropriate month to write about "income." My grandfather always used to exclaim, "Be happy you have to pay taxes! That means you're making money!" However, there aren't many individuals with disabilities who make enough to worry about paying income tax. In fact, the economic outlook for people with disabilities is not particularly promising, especially after they leave high school. Technological advances have provided tremendous employment opportunities for individuals with physical disabilities, but for those with cognitive disabilities, successful employment outcomes have been far fewer.

There is some good news here, though. "Disability Determination for Mental Retardation," a report released recently from the National Research Council, focuses on the scientific base and current clinical practices in diagnosing mental retardation for the purpose of awarding disability benefits. Individuals with mental retardation comprise the largest diagnostic category of children receiving supplemental security income (SSI), 26.4 percent of the total, and thus are the focus of this report. Many parents and service providers don't realize that receipt of benefits from the Social Security Administration (SSA) programs can provide a "critical gateway" to other federal and state benefits.

While the report from the National Research Council has most relevance for individuals who have IQ scores at or around 60 to 70 (known as having "mild mental retardation"), it has implications for other disability recipients, their parents or careproviders, and professionals who provide services to this population. The report is based on state-of-the-art research in disability and mental retardation, and thus is oriented toward a scientific as well as a policy perspective.

What's new about this report?

The French have a saying, *plus ça change, plus c'est la même chose*. So, too, with definitions of retardation, "the more things change, the more things stay the same." It is important to know that the definition of mental retardation (MR) used by the SSA differs somewhat from that of many major professional and healthcare organizations. Indeed, as you read this, the American Association on Mental Retardation (AAMR) is considering, again, both a name and a definition change. Here are the aspects of SSA's definition that are relevant for eligibility purposes.

The current practice of considering both intelligence (as measured by traditional IQ tests) and adaptive behavior as critical components of MR will continue. The new recommendations pertain to the specific types of instruments to be used in determining eligibility. For example, for testing IQ, the committee recommends using only comprehensive, multi-factored (statistically defensible) intelligence tests that have recent and valid norms. The child, youth or adult tested must have a total IQ score (sometimes called a "full" or "composite" score) at or below 70, or a part score (i.e., score on a subsection of the IQ measure) at or below 70. Still under debate by the SSA is whether a composite score out of the mental retardation range will be accepted in the presence of a low part score. The report lists acceptable instruments for infants, children and adults, and many of the names are recognizable: Bayley Scales of Infant Development-II; Kaufman Assessment Battery for Children; Stanford-Binet Intelligence Scale, Fourth Edition; Wechsler Intelligence Scales (for preschool, children, adults).

Adaptive behavior is still a key dimension of mental retardation, and again, standardized instruments are recommended. Recommendations for adaptive behavior, as for IQ, are further divided by age and associated developmental expectations (infancy/early childhood, birth-4; childhood, 5-17; adolescence/adulthood, 18 and older). Actual domains of adaptive behavior vary more obviously by developmental level. For example, academic skills don't become critical adaptive components until the school-age years, and work-related skills don't enter into the picture until adolescence or adulthood.

In addition to recommending more reliable and scientifically valid instruments for determining MR, the report offers a number of recommendations about carrying out the determination process itself. As always, when an evaluation of their child is concerned, parents may wish to seek information about their examiner's credentials and the instruments selected for use in assessment, especially when seeking determination of MR for SSI eligibility purposes. Still, IQ and adaptive behavior assess-

Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, and had been a researcher for over 25 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of retardation, dual diagnosis,and the transition to adulthood. Dr. Blacher has developed **Research Reflections** as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to **Research Reflections** and any suggestions you might have. Send e-mail to: jan.blacher@ucr.edu.

ment remain the key components in determining eligibility.

Your children will also be eligible for benefits if they have a total IQ score of 59 or less, or if they have any other condition so disabling it interferes with a determination of true intelligence; such conditions could include blindness, deafness, uncontrolled seizures, or cerebral palsy.

Does SSI have anything to do with my child's schooling?

IDEALLY, it should! The future employability of children with mental retardation is clearly influenced by the preparation they receive during their formal, usually public, schooling. Since the passage of the Individuals with Disabilities Education Act Amendments of 1997 (IDEA '97), schools have been mandated to develop Individualized Transition Plans, or ITPs, for all adolescents with disabilities. This process should begin at age 14, or younger, if so determined by the child's IEP team. At least 200,000 young people with disabilities are exiting the school system each year and entering the adult world. The cornerstone of most ITPs is the generation of a plan to prepare the young adult for employment. The development of these plans should involve input from, and an interview with, the adolescent whenever possible, to determine preferences and skills. Parents, too, should be substantively involved in the development of this vocational plan.

The National Research Council report notes that, regardless of an adolescent's specific disability, discussion of work-related issues in the ITP should include information about SSI. Ironically, individuals with milder disabilities, specifically mild mental retardation, are at high risk of dropping out of high school, thus losing the support of the special education system. Once they are away from any formal service system such as school, these young people may not even have a chance to find out about SSI, much less know how to apply. SSI does indeed constitute a critical safety net for this vulnerable group, and we need to make sure that all eligible people can access this crucial system of support.

Do I need to think NOW about my child's employment after high school?

It's never too early to think about our children's future. However, many parents of children with mental retardation or other cognitive disabilities put off thinking about their children's future employability. The core concepts of this transition from school to work, as identified by most researchers, include: (1) involvement in meaningful and worthwhile activities in

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

Early hyperbaric oxygenation therapy (HBOT) is a promising treatment for cerebral palsy and the brain-injured child. A recent symposium presented documentation from 17 countries substantiating the positive effects, which may even benefit the fetus in utero by having the mother undergo HBOT.

While hyperbaric oxygen treatment proved effective in older cerebral palsy patients (the oldest CP patient was treated successfully in the UK at the age of 59), substantial evidence from around the world strongly suggests that early intervention brings about superior results. An Italian study revealed that problems detected in a fetus may be treated in utero by placing the mother in a chamber. In Mexico and other areas, newborns with problems associated with a lack of oxygen are taken from the delivery room to a chamber. Frequently, in as little as one hour, HBOT may alter a child's entire life.

At the **Ocean Hyperbaric Neurologic Center**, we have treated patients as young as six weeks of age. With proper chamber pressure and treatment techniques, there are very few side effects. This early intervention does not preclude the treatment of older children. However, the earlier the treatment, the faster the improvement.

Coming Soon!

Hyperbaric Oxygenation for Cerebral Palsy and the Brain-Injured Child

by R. A. Neubauer, M.D.

Dr. Neubauer's new book is a complete guide written for the professional as well as the caregiver of exceptional children. The book describes the latest information on hyperbaric oxygenation therapy including improved brain function as visualized through functional imaging. Clinical and scientific data along with references are included.

the broader community; (2) some form of independent living (outside of the family home); and (3) economic self-efficiency.

While employment receives nearly all the attention in the literature on research and practice, practical applications of the transition concept developed in IDEA '97 do exist. Carolyn Hughes at Vanderbilt University and her colleagues have developed a Transition Support Model that makes 600 or so transition strategies available to practitioners and parents in *The Transition Handbook* (Paul H. Brookes, 2000). This book promotes the philosophy that people cannot be expected to function at their best in all post-secondary-school environments, and therefore careful choices need to be made. Furthermore, some adolescents and young adults will need more—or less—support in areas of work and adaptation to community living.

With such supports, Hughes and her team might argue that anyone can be successfully employed. However, the SSA makes supplemental security income (SSI) available for those who cannot obtain or maintain such employment because, for whatever reasons, local employers are ill equipped to provide necessary supports or because, even where these supports are in place, their existence cannot always be guaranteed. Thus, only by allowing young adults to become immediately re-eligible for SSI at the point of employment loss will this program truly be a safety net; otherwise, it might as well be a very large bungee cord.

To sum up

The old adage that "the only thing you can count on in life is death and taxes" may not hold true here. You can also count on the fact that Social Security has established a nationwide network of community-based organizations to provide benefit planning, assistance and outreach to individuals with disabilities who want to work. (Web site, http://www.ssa.gov/work/). Moreover, support models that involve collaboration among researchers, teachers and parents will continue to smooth the transition from high school to employment. Of course, fluctuations in the overall national economy will always have a substantial influence on government benefits and entitlements, but current trends indicate that SSI can provide the needed safety net for all persons with mental retardation in financial need. **EP**

This article was based on the following report: National Research Council (2002). Disability determination for mental retardation. Committee on Disability Determination for mental retardation. Daniel J. Reschly, Tracy G. Myers, & Christine R. Hartel, editors. Division of Behavioral and Social Sciences and Education. Washington, D.C.: National Academy Press.

Never in my Wildest dreams...

"WHEN I FIRST CAME TO CROTCHED MOUNTAIN OVER 10 YEARS AGO, activities that were second nature prior to the automobile accident were challenging tasks. Today I am a college graduate and also have my drivers license.

Never in my wildest dreams would I have been able to do half of what I've achieved without the encouragement and help that I received at Crotched Mountain! I want to thank everyone at Crotched Mountain for helping me get my life back!"

Exceptional Parent Magazine

Welcome Resources Technology **Edu/Toys** **Healthcare** Subscribe

eparent.com

New! Visit the EP Web site, EParent.com, and discover...

TOYS—The new eToys Web site (www.etoys.com) teams with EP's Web site, EParent.com (www.eparent.com) to offer ideas, information and imaginative toys for families with kids who have special needs. When parents, teachers or caregivers shop at eToys and visit the co-branded EParent.com site, they'll find hand picked toys and games, plus featured articles from EP Magazine. The site also features direct links to the EParent.com shop at eToys, and eToys products recommended by experts or reviewed by organizations chosen by EP Magazine.

EDUCATION—EParent.com's newly-constructed Education channel (EDU/TOYS tab) yields a wealth of current articles on topics such as IDEA, IEPs, assistive technology, transitioning and inclusion. These are supplemented by a growing directory of schools, camps & residences, which can be found in the "Directories" link of the "Resources" channel.

ON-LINE ARCHIVES—Now, EParent.com users can preform keyword searches through our on-line archives and purchase articles which have appeared, as far back as in the eighties, in EP Magazine (recipient of awards from Folio:The Magazine for Magazine Management, Easter Seals, Consumer Healthcare Group). These include classic pieces on such subjects as early childhood, rare disorders, technology, education, medical research update, transitioning, travel, all of which have distinguished EP Magazine through the years.

MORE TO COME IN 2002—You can also click through our EP Library (www.eplibrary.com) which contains books, videos and software encompassing almost 50 specific and general categories, with more than 650 titles. Of course, we will continue to refresh and improve EParent.com in 2002, and look forward to receiving your comments and suggestions. Log on and find out what we are all about!

LEARNING SENSATIONS™ PLAY WITH LETTERS DESK

Learning Sensations Play with Letters Desk is an electronic toy with 26 textured and Braille letter tiles that provide three fun and stimulating ways to learn the alphabet. To activate the letter tile simply roll it across any hard surface up to three feet away from the desk. When activated, the tiles teach the alphabet by using corresponding phonics, words, music and colors. It offers tests on letter identification, color recognition and simple spelling. The desk features a writing surface, letter display area, volume control and automatic shut off. It also has a storage area and carrying handle for transport.

PARENT ADVOCATE

Visiting Nurse Service of New York has an excellent opportunity for an individual with experience rearing a child with a serious emotional or mental condition. Our mission is to empower families and maximize their strengths so that they may provide nurturing environments that support their children's development, advocate for needed changes in their children's service delivery systems, and become independent from the welfare system.

PARENT ADVOCATE

Family Connection Program
Brooklyn/Manhattan

Serve as an advocate for each family; assist Program staff and families in their efforts to find and obtain services from community agencies; and act as a liaison between the client and appropriate supplemental support services. Accompany clients to health, entitlement, educational, and other appointments. Requires a HS diploma or equivalent. Bilingual English/Spanish preferred.

We offer competitive compensation and a comprehensive benefits package. For immediate consideration, please submit your scannable resume (in Courier or Times Roman font, no bold, italics, underscoring or handwritten notations), with Ad Code EPM-040102-A, to Attn G. Gangadeen, via: Online: www.vnsny.org (preferred), E-mail: careers@vnsny.org, Fax: 212-504-7938, or Call: 1-866-VNS-TODAY. EOE M/F/D/V.

"Train of Thoughts"

by Carlie Grippi

I ride on a train of thoughts,
I made a nick in time.
What does it mean to have bare feet?
And can you drink a whine?
Can you ever eat a date?
Or send a deck of cards?
And if I put three feet together,
would they fill the yard?
Does a finished book become bright red?
Can water really see?
Is a riverbank filled with money?
I've climbed my family tree.
Where is the head of the class?
I've given a dozen stares,
I wonder what the number ate?
I've seen those Easter hairs!
I've eaten the color orange,
and eaten little peas,
and I've stepped in a cherry pit,
and drunk a cup of tea.
I write my letters with a pigpen,
and swim in a game of pool.
Juries sit in tennis courts,
and all fish go to school.
Does blowing turning a whistle blue?
Do window shades go blind?
I take nice walks with candy canes,
and the ones who are smart will mind.
All of these words put together
mean different things as we see.
And I must say in my own words,
OUR LANGUAGE CONFUSES ME!

Carlie is 17 and attends the Ohio State School for the Blind. She plans to attend college after graduation and is considering Bowling Green State University or Gallaudet University. She would like to be a writer, perhaps even a songwriter. She enjoys all types of music, especially country music. Her favorite hobbies include running, swimming, writing, and hanging out alone or with friends. Carlie has CHARGE syndrome and uses a "Link" to communicate. The link is a voice output communication device much like a combination TTY/laptop computer. It has a visual display that reads what is typed. She is learning Braille and ASL. She has attended many summer camps and volunteers at her local MR/DD. EP

Thanks to the Great Lakes ARea Regional Center for DeafBlind Education for submitting Carlie's poem.

Submit your Children's Page to: EP, ATTN: CHILDREN'S PAGE, 65 East Route 4, River Edge, NJ 07661. A Better Bedtime Story

The Vail Enclosed Bed

Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt. Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

For people with severe spasticity due to cerebral palsy, brain injury, or spinal cord injury

There is something you can do about severe spasticity. Oral medications may help some people with severe spasticity, but for many, it may not be effective or may cause intolerable side effects. When spasticity continues to interfere with the way you live, there is something you can do about it.

ITB™ Therapy (Intrathecal Baclofen Therapy) is an effective way to control severe spasticity. A medication called Lioresal® Intrathecal (baclofen injection) is delivered directly to where it's needed most — in the fluid that surrounds the spinal cord. In clinical studies, ITB Therapy reduced spasticity during the screening test in 97%[1] of people with severe spasticity due to multiple sclerosis or spinal cord injury, and in 86%[1] of people with severe spasticity due to cerebral palsy or brain injury.

Take the first step. Find out how the therapy can work for you. Talk to your doctor about the screening test, which uses a small amount of medication to test if it will work for you. For more information call us today at 800-664-5111 Ext. 220. Or, you can log on to www.spasticity.com.

ITB Therapy drug side effects are usually temporary and manageable by adjusting the dose. The most common side effects include loose muscles, drowsiness, nausea/vomiting, headache, and dizziness. Close attention to your doctor's instructions is required since abrupt discontinuation of intrathecal baclofen can result in high fever, altered mental status, returned spasticity, and muscle rigidity, and in rare cases has been fatal. (For more information, please read the attached Lioresal Intrathecal Patient Information on the back.)

First Time in Her Life.

Patient Information

LIORESAL® INTRATHECAL
(baclofen injection 10 mg/5 mL, 10 mg/20 mL, 0.05 mg/1 mL)

Completely read this information before you start using Medtronic ITB™ Therapy (Intrathecal Baclofen Therapy). This information does not take the place of thorough discussions with your doctor. You and your doctor should discuss ITB Therapy before you begin receiving the therapy and at regular refill appointments.

Q: What is Lioresal® Intrathecal (baclofen injection)?

A: Lioresal Intrathecal is a liquid form of baclofen, and is commonly used to treat severe spasticity. Liquid baclofen is used for injections and infusion into the intrathecal space (the fluid-filled area surrounding the spinal cord), using an implantable drug delivery system.

Q: What is severe spasticity?

A: Severe spasticity is tight, stiff muscles that make movements – especially of the arms and legs – difficult or uncontrollable. Severe spasticity can interfere with an individual's function and/or comfort.

Q Who is a candidate for Lioresal Intrathecal?

A: People who suffer from severe spasticity resulting from cerebral palsy, multiple sclerosis, stroke, traumatic brain injury, or spinal cord injury, and who suffer intolerable side effects from oral baclofen (pills), may be a candidate for Lioresal Intrathecal. A screening test will help determine if you will respond to the intrathecal medication. Talk with your doctor about whether Lioresal Intrathecal may be an option for you.

Q: Who is *not* a candidate for Lioresal Intrathecal?

A: People who are hypersensitive (extremely sensitive) to oral baclofen should not take Lioresal Intrathecal.

Q: What are the most common side effects of Lioresal Intrathecal?

A: The side effects of intrathecal baclofen include loose muscles, sleepiness, upset stomach, vomiting, headaches, and dizziness. As with most medications, overdose (drug dose is too high) or under dose (drug dose is too low) can occur. Talk with your doctor about the side effects you may experience from your treatment.

Q: What do I need to know if I am using Lioresal Intrathecal?

A: Abruptly stopping intrathecal baclofen can result in serious medical problems and in rare cases has been fatal.

Q: What are the signs of rapid or abrupt withdrawal from intrathecal baclofen?

A: Increase or return in spasticity, itching, low blood pressure, lightheadedness, and tingling sensation are often early indications of baclofen withdrawal. It is very important that your doctor be called right away if you experience any of the above symptoms.

In rare cases, severe symptoms may occur. These symptoms include high fever, altered mental status, spasticity worse than before you started ITB Therapy, and muscle rigidity. It is very important that your doctor be called right away if you experience any of the above symptoms.

Q: What can I do to prevent baclofen underdose or abrupt discontinuation of intrathecal baclofen?

A: It is very important that you keep all of your refill appointments. This may require some planning prior to traveling. Maintaining a regular refill schedule will ensure the pump does not run out of medication and that any potential problems with the infusion system are diagnosed and corrected. Additionally, you should be aware of what your pump alarms sound like. If you hear the alarm, contact your doctor immediately.

Furthermore, it is very important that you know and understand the signs of baclofen underdose. Also be sure to tell your doctor right away if you experience any unusual symptoms, side effects, or changes in your condition.

Q: What are the symptoms of baclofen overdose?

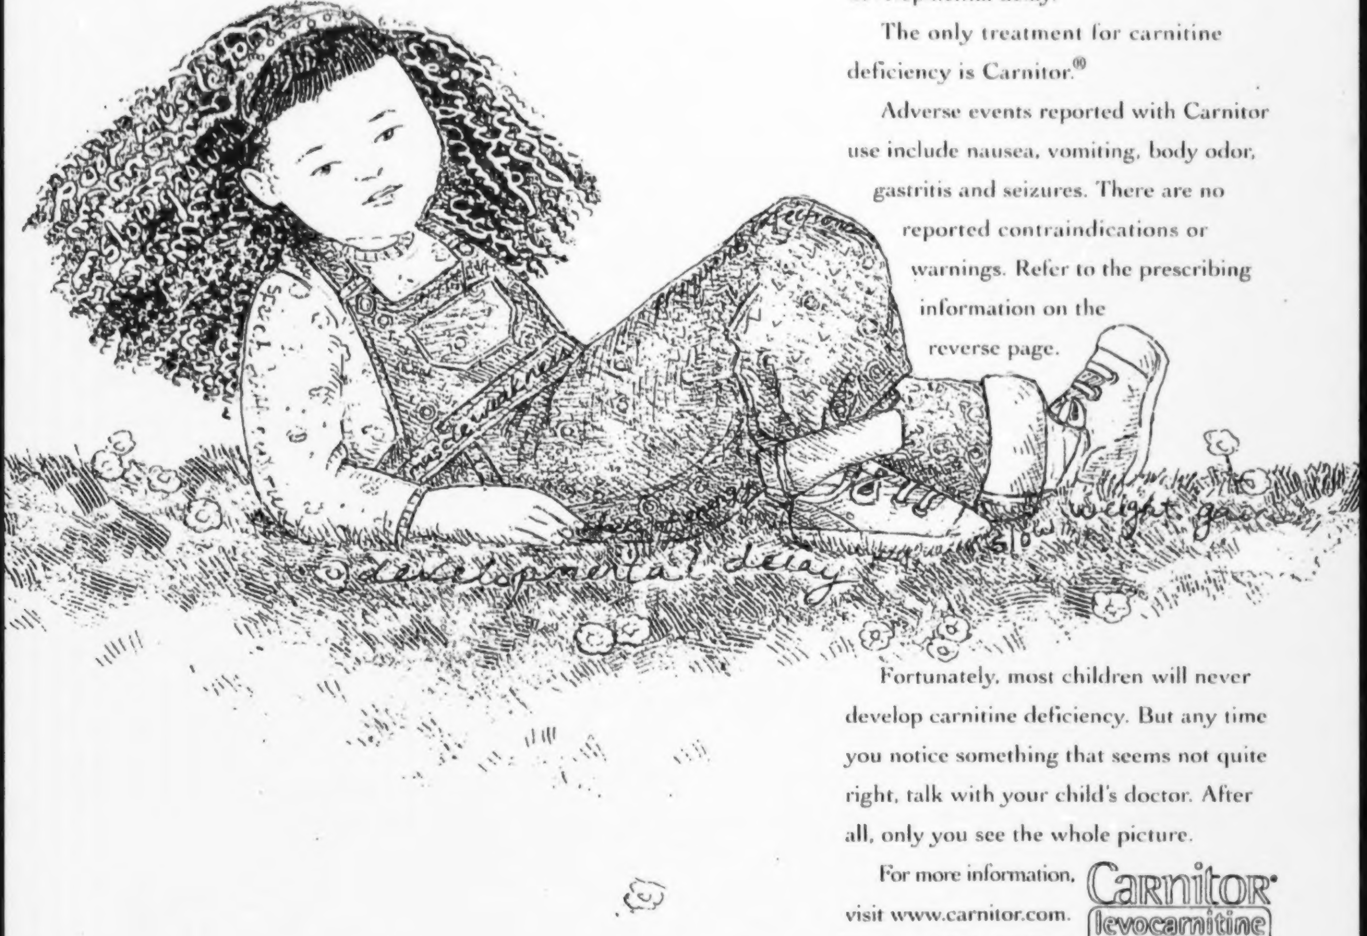
A: Although rare, it is possible for you to receive too much medication (overdose). A baclofen overdose may cause drowsiness, lightheadedness, respiratory depression (difficulty breathing), seizures, loss of consciousness and coma. If you experience any of the above symptoms, it is very important that you or your caregiver contact your doctor right away.

Rx only.

Lioresal® is a registered trademark of Novartis Pharmaceuticals Corporation.

This provides a summary of the most important information about Lioresal Intrathecal. If you would like more information, talk with your doctor. You can ask for information about Lioresal Intrathecal that is written for healthcare professionals. You also can get more information by visiting www.spasticity.com.

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?



No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.

Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

Discover the faces of Children's Hospital

Everyday we take special care of children. From broken bones to long-term care, from infants to teens. It's our understanding of children and their families that makes us unique.

For over 80 years now, Richmond's Children's Hospital has been providing specialty pediatric care. We understand children. And what it takes to tailor our services to their individual needs.

Take for example, our Pediatric Feeding Disorders Program, one of only a few such services in the country.

Or our Inpatient Rehabilitation Program which helps children who have experienced trauma, disease or impairments return to the activities of daily life.

For adolescents who need subacute care to babies who have never seen the outside world, our Transitional Care Unit is a step toward home. And a place where parents learn to care for their child's special needs.

Discover where children come first.

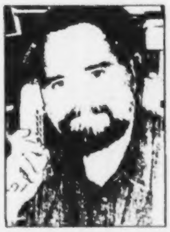
"What Happened to You?" and Other Clinical Ice Breakers



There's an old vaudeville routine with a doctor asking his patient, "So tell me, Mr. Lawson, what brought you to my office today?" The patient replies "The number seven trolley, Doc, same as always." It probably wasn't funny even back at the Loews Brevoort.

Opening remarks, especially the first sentences of sonnets, declarations of war, great novels or examination room "lead-ins," are significant. There are books with compilations of the first sentences of great literature, presidential inaugural addresses, Oscar-winning acceptance speeches, half-time locker room sermons and Star Trek episodes, all attesting to the notion that "openings" are powerful thresholds to human transaction.

Medical school teaches "how to take a patient's history," but they don't teach you how to begin to take a patient's history. Popular spiral-bound manuals, lodged like marsupials in the pockets of students' white clinic coats, suggest "eliciting the presenting complaint." Fourth-year senior clinical clerks clutch index cards scrawled with "when did whatever is bothering you first start," an opening as inviting as the student snapping on a glove and spreading some lubricant on his fluttering index finger. The noted physician/educator Paul Hamilton Wood was fond of saying that "the best history taker is he who can best interpret the answer to a leading question." The doyen of medical education, Sir William Osler, hammered "ask the patient what's wrong, he wants to tell you." Two great axioms, for sure, but neither brings the novice to the most effective opening statement. There is a sparseness of literature that addresses the question "what to say after you appear and stop fidgeting with the stethoscope draped around your neck."

When the question is directed not to patients themselves, but to the parents (as in the case of so many EP readers), the stakes can be high. Opening lines reveal a lot about the physician and his/her attitudes, capacity for partnering, harmony, approach and flow. It's simple propulsive physics: ask the right question and you'll get the right answer (if there is such a thing). So what's the physician, counselor or therapist to start out with in order to get the dialogue going in a productive, revealing and comprehensive flow?

Dr. Ralph I. Horowitz, chairman of the Department of Internal Medicine at the Yale School of Medicine, recently addressed this very same question. The school conducted an interactive doctor/patient theatrical performance called "Rounding It Out," in the hope that physicians and medical students would gain an appreciation for this ritual. Conducting the program was Anna Deavere Smith, who has emerged as the premiere teacher in the art of listening. Smith has distinguished herself teaching listening skills to law students in addition to teaching performance studies and theater at major universities.

Dr. Horowitz remarked that "the most remarkable part of what took place was how little probing it took for her to hear stories from patients that we almost never hear." Horowitz offers that physicians by nature are disease-oriented, while Smith's role was to redirect the focus to be people-oriented.

Ms. Smith suggested the opening question below to get patients to share their stories—stories that are not disease-specific but reveal the nature of the disease and its impact, significance and meaning. These are the criteria that should send the physicians of tomorrow scurrying for their yellow highlighters. These are the things that make a history come alive and must be incorporated into a mutually agreed-upon plan of action.

"What happened to you?"

When was the last time a physician asked you that question? It's one of those pearls, those eurekas, those epiphanies. It's an invitation accompanied by a gesture that says "go on, I won't interrupt you." It's a question that smoothes the road ahead; it lets the patient and/or the parent know that the physician is prepared to hear the goods, to listen and learn. It's a question that a friend might pose to you after seeing how lousy you looked, that something assuredly had to have happened to you. Throw out that question, lean your body in the patient's (or parent's) direction as if what you're about to hear is the most important thing you have heard all day and then click on your seat belt. Chances are that you, the clinician, are in for the history-taking ride of your life. History taking is an art, one that requires a canvas, a palette and an astute eye. The parents, the patients, will supply the canvas and the palette; the rest is up to the physician.

Karen W. Arenson, in an article about Smith in the New York Times (Education Life, 13 January 2002), reports that "a linguist once told [Smith] there are three questions that will get anyone talking: What were the circumstances of your birth? Have you ever come close to death? Have you ever been accused of something you didn't do?"

My revised list of the three questions that will always get an exceptional parent talking are:

"When did you first notice something was wrong with your child? What has been your greatest frustration in dealing with the 'system'? and What is your single greatest wish for your child?"

Pose one of those questions to parents of a child with special healthcare needs—heck, you can even forgo leaning your body toward them—and you will get an earful. An earful made up not of mere words, but of ongoing sagas; not polished recitations, but heartfelt recollections that are subject to change with each telling. Storytelling from storytellers who want to be heard. Exceptional stories, extraordinary histories, incredible recountings. Ask an exceptional parent "what happened" and you will not only hear what happened; you can bank on hearing what's happening now and what's gonna happen next, because one thing is sure of EPers. While they may be stunned at times, they're but moments away from calculating their next steps, their next moves.

My revision to Smith's "magic bullet" opening question is: don't ask an exceptional parent "what happened to you?"; rather, simply ask "what have you made happen?" EP

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

BEST COPY AVAILABLE

VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

VNS THERAPY™

VAGUS NERVE STIMULATION

Cyberonics

Circle #32 or visit www.eparent.com/adinfo

EXECUTIVE SUMMARY[1]
SAFETY INFORMATION
FOR THE NCP® SYSTEM

INTENDED USE / INDICATIONS – UNITED STATES

The NCP System is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications.

CONTRAINDICATIONS

- The NCP System cannot be used in patients after a bilateral or left cervical vagotomy.
- Do not use short-wave diathermy, microwave diathermy, or therapeutic ultrasound diathermy on patients implanted with the NCP System. Diagnostic ultrasound is not included in this contraindication.

WARNINGS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals. This is not intended to serve as a substitute for the complete NCP System Physician's Manual.

The **safety and efficacy** of the NCP System has not been established for uses not covered in the "Intended Use/ Indications" section of the manual.

The safety and efficacy of the NCP System treatment has not been established for stimulation of the **right vagus nerve** or of any other nerve, muscle, or tissue.

Excessive stimulation at a combination of high frequency (≥ 50 Hz) and an excess duty cycle (that is, one that occurs when ON time is greater than OFF time) has resulted in degenerative nerve damage in laboratory animals. An excess duty cycle can be produced by continuous or frequent magnet activation (> 8 hours), as determined by animal studies. Cyberonics recommends against stimulation at these combinations of ranges.

Aspiration may result from the increased swallowing difficulties reported by some patients during stimulation. Patients who have **pre-existing swallowing difficulties** are at greater risk for aspiration.

Device malfunction could cause painful stimulation or direct current stimulation. Either event could cause nerve damage and other associated problems. Patients should be instructed to use the magnet to stop stimulation if they suspect a malfunction, and then to contact their physician immediately for further evaluation. Prompt surgical intervention may be required if a malfunction occurs.

Susceptible patients with predisposed cardiac conduction systems (re-entry pathway) have not been studied as part of controlled clinical trials to establish the safety of NCP system treatment in these patients. Evaluation by a cardiologist is recommended if the family history, patient history, or electrocardiogram suggests an abnormal cardiac conduction pathway. Serum electrolytes, magnesium, and calcium should be documented before implantation. Post-implant electrocardiograms and Holter monitoring are recommended if clinically indicated.

Sudden unexplained death in epilepsy (SUDEP): Through August 1996, 10 sudden and unexplained deaths (definite, probable, and possible) were recorded among the 1,000 patients implanted and treated with the NCP device. During this period, these patients had accumulated 2,017 patient-years of exposure. Some of these deaths could represent seizure-related deaths in which the seizure was not observed, at night, for example. This number represents an incidence of 5.0 definite, probable, and possible SUDEP deaths per 1,000 patient-years. Although this rate exceeds that expected in a healthy (nonepileptic) population matched for age and sex, it is within the range of estimates for epilepsy patients not receiving vagus nerve stimulation, ranging from 1.3 SUDEP deaths for the general population of patients with epilepsy, to 3.5 (for definite and probable) for a recently studied antiepileptic drug (AED) clinical trial population similar to the NCP System clinical cohort, to 9.3 for patients with partial onset epilepsy.

The NCP device is not curative: Physicians should warn patients that the NCP System is not a cure for epilepsy and that since seizures may occur unexpectedly, patients should consult with a physician before engaging in un-supervised activities, such as driving, swimming, and bathing, and in strenuous sports that could harm them or others.

Obstructive Sleep Apnea: Patients with obstructive sleep apnea (OSA) may have increased apneic events during stimulation. Cyberonics recommends care when treating patients with preexisting OSA. Lowering stimulus frequency or prolonging OFF time may prevent exacerbation of OSA.

PRECAUTIONS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals.

Laryngeal irritation may result from stimulation. **Patients who smoke** may have an increased risk of laryngeal irritation.

Dyspnea may result from stimulation. **Patients with chronic obstructive pulmonary disease** may have an increased risk of dyspnea.

It is important to follow **recommended implantation procedures and intraoperative product testing** described in this manual. During the intraoperative Lead Test, rare incidents of bradycardia and/or asystole have occurred. As of October 1998, approximately 3,000 patients had been implanted with the NCP System. Four of these patients were reported to have experienced **bradycardia and/or asystole** during the intraoperative Lead Test. All four patients recovered without sequelae. One of the four patients was implanted with the NCP System. There were no postoperative or VNS-treatment-related cardiac adverse events later reported for that patient. No similar events were reported to have occurred during the clinical studies at the time of implantation or during treatment. The safety of this therapy has not been systematically established for patients experiencing bradycardia or asystole during NCP System implantation.

Reversal of lead polarity has been associated with an increased chance of bradycardia in animal studies. It is important to make sure that the Lead connector pins are correctly inserted (white marker to + connection) into the Pulse Generator header.

It is important to follow **infection control procedures**. Infections related to any implanted device are difficult to treat and may require that the device be explanted. Cyberonics recommends that the patient be given antibiotics preoperatively. The surgeon should ensure that all instruments, including the NCP Tunneling Tool, are sterile prior to the operation.

The NCP System is indicated for use only in stimulating the **left vagus nerve** in the neck area inside the carotid sheath.

The NCP System is indicated for use only in stimulating the **left vagus nerve below where the superior and inferior cervical cardiac branches separate from the vagus nerve.**

A neck brace can be used by the patient for the first week to help ensure proper Bipolar Lead stabilization.

Environmental and Medical Therapy Hazards

Patients should exercise reasonable caution in avoiding devices that generate a **strong electric or magnetic field.** (For examples, see the "Other Environmental Hazards" section of the Physician's Manual.) If a Pulse Generator ceases operation while in the presence of electromagnetic interference (EMI), moving away from the source may allow it to return to its normal mode of operation.

NCP System operation **should always be checked** by performing device diagnostics after any of the procedures mentioned in the Physician's Manual.

Because of where the Pulse Generator is implanted in the chest, **patients may need to be specially positioned in mammography equipment for clear imaging.** Otherwise, the device may be seen as a shadow on the mammogram. (Most routine diagnostic procedures, such as fluoroscopy and x-radiography, are not expected to affect system operation.)

Therapeutic radiation may damage the Pulse Generator's circuitry, although no testing has been done to date and no definite information on radiation effects is available. Sources of such radiation include therapeutic x-rays, cobalt machines, and linear accelerators. The radiation effect is cumulative, with the total dosage determining the extent of damage. The effects of exposure to such radiation can range from a temporary disturbance to permanent damage, and may not be detectable immediately.

External defibrillation may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for external defibrillation.

Electrocautery surgery may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for electrocautery surgery.

Magnetic resonance imaging (MRI) should not be performed with a magnetic resonance body coil in the transmit mode. The heat induced in the Bipolar Lead by an MRI body scan can cause injury.

Use caution when other MRI systems are used, since adverse events may occur because of different magnetic field distributions.

No scan in which the radiofrequency (RF) is transmitted by the body coil should be done on a patient who has the NCP System. Thus, protocols must not be used which utilize local coils that are RF-receive only, with RF-transmit performed by the body coil. Note that some RF head coils are receive only, and that most other local coils, such as knee and spinal coils, are also RF-receive only. **These coils must not be used in patients with the NCP System.**

Therapeutic ultrasound. Routine therapeutic ultrasound could damage the Pulse Generator and may be inadvertently concentrated by the device, causing harm to the patient.

Extracorporeal shockwave lithotripsy may damage the Pulse Generator. If therapeutic ultrasound therapy is required, avoid positioning the Pulse Generator part of the body in the water bath or in any other position that would expose it to ultrasound therapy. If that positioning cannot be avoided, program the Pulse Generator output to 0 mA for the treatment, and then after therapy, reprogram the Pulse Generator to the original parameters.

Diagnostic ultrasound is not expected to affect the NCP System.

The Pulse Generator may affect the operation of **other implanted devices,** such as cardiac pacemakers and implantable defibrillators. Possible effects include sensing problems and inappropriate Pulse Generator responses. If the Pulse Generator patient requires concurrent implantable pacemaker and/or defibrillator therapy, careful programming of each system is necessary to optimize the patient's benefit from each device.

ADVERSE EVENTS

Adverse events reported during clinical studies as statistically significant are listed in alphabetical order Ataxia (muscle movements or twitching, generally associated with stimulation); Dyspepsia (indigestion); Dyspnea (difficulty breathing, shortness of breath); Hypesthesia (impaired sense of touch); Increased coughing; Infection; Insomnia (inability to sleep); Laryngismus (throat, larnx spasms); Nausea; Pain; Paresthesia (prickling of the skin); Pharyngitis (inflammation of the pharnyx, throat); Voice alteration (hoarseness);Vomiting.

Other potential adverse events possibly associated with surgery or stimulation include but are not limited to the following:

Aspiration (fluid in the lungs); Blood clotting; Choking sensation; Damage to nerves or vasculature in the surgical area, including the carotid artery and jugular vein; Device (Generator and/or Lead) migration or extrusion; Dizziness; Dysphagia (difficulty swallowing); Duodenal ulcer, gastric ulcer; Ear pain; Facial flushing; Facial paralysis, paresis; Foreign body reaction to implants, including possible tumor formation; Formation of fibrous tissue, pockets of fluid; Heart rate and rhythm changes; Hiccuping; Incision site pain; Irritability; Laryngeal irritation (sore, painful throat); Left hemidiaphragm paralysis; Left recurrent laryngeal nerve injury; Left vocal cord paralysis; Low-grade fever; Muscle pain; Neck pain; Nerve injury; Painful or irregular stimulation; Skin, tissue reaction; Stomach discomfort; Tinnitus (ringing in the ears); Tooth pain; Unusual scarring at the incision site; Urinary retention; Vagus nerve paralysis; Weight change; Worsening of asthma and bronchitis; Worsening of cardiac abnormalities, including heart rate and rhythm.

Patients who manipulate the Pulse Generator and Bipolar Lead through the skin may damage or disconnect the Bipolar Lead from the Pulse Generator and/or possibly cause damage to the vagus nerve.

---

[1] The information contained in this Executive Summary for Physicians represents partial excerpts of important prescribing information taken from the *NCP Pulse Generator Physician's Manual*. The information is not intended to serve as a substitute for a complete and through understanding of the material presented in all of the Physician Manuals for the NCP System and its component parts nor does this information represent full disclosure of all pertinent information concerning the use of this product, potential safety complications, or efficacy outcomes.

Huntington prognosis

I am the mother of two boys, ages 10 and 8 years, who have been diagnosed with Huntington disease. It was inherited from their father's family. Recently, their father told me that he is now showing signs of the disease, which has killed his brother, mother and grandfather. My 10-year-old is at an early second grade level and the 8-year-old is the same but going down hill. Both boys are very loving and happy all the time, but tire easily when playing with other kids. I would like to hear the experiences of other parents of children with HD so I may know about what to expect in the future.

—89 via EP Web site

Editor's Note: The Huntington Disease Society of America is a resource for information and advocacy. Their Web site can be accessed at: http://www.hdsa.org/

S

Elevated lactic acid levels with brain abnormality

My 16-month-old son has a developmental brain abnormality (polymicrogyria, pachygyria, and demylination of the white matter). There are other children with this but he also has elevated lactic acid levels. He also has microcephaly and is developmentally delayed in all areas. I'm searching for someone who has the diagnosis that my son has so I have some idea of what to expect of prognosis. We have been recommended to go for a mitochondrial work-up. One of our questions is, will the lactic acidemia have an effect on him?

S

College for a child with ADHD/LD

My son is 18 and a senior in high school. He has ADHD and an auditory integration problem. He has struggled to have a grade-point average acceptable to most colleges, but his ACT scores are strong enough to go to college. Are there any colleges or universities that address learning disabilities and really offer students the help they need to get through college? We have been working toward independence in study, but our son is still not there yet.

—M.S. via EP Web site

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our Web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our Web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

EP PROUDLY ANNOUNCES TWO NEW COLUMNS! TECH TALK & SPORTS CORNER

Beginning in the June issue, EP will introduce two new occasional columns, *Tech Talk* and *Sports Corner*. *Tech Talk* will address practical ways to integrate technology into educational, work and home environments. *Sports Corner* will cover adaptive sports, recreation and fitness. Readers will have the opportunity to have their questions answered in these columns. E-mail your question to epedit@aol.com and indicate the name of the column in the subject line. Be sure to provide your city and state. Young readers should also include their age.

S

Kleeblattschadel syndrome

My 3-year-old daughter was born with Kleeblattschadel syndrome (cloverleaf skull syndrome). It is a severe form of craniosynostosis. She has had many surgeries since she has been born. She also has a trach tube for airway, because her mid-face is compacted and will need surgeries in the future. She is my only child. She has had genetic testing, but so far they do not know how this happened or why. I was wondering if anyone has been through this and if they have any other children who were born without disabilities.

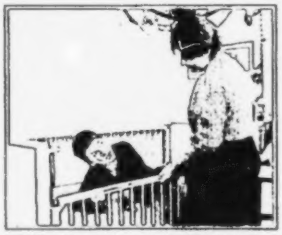
HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas



The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs, as well as locating your nearest HARD dealer, please give me a call.

on treatment or therapies for agenesis of the corpus callosum (ACC). My daughter, who is 5 years old was diagnosed with ACC at age of 2. I currently have her in Early Intervention, where she receives speech, physical and occupational therapies. Her neurologist has diagnosed her as having mild retardation and autism. She can walk, but no running, jumping, or climbing. She will sometimes feed herself finger food. She has no verbal skills. She has been treated for strabismus, and although children with ACC are sometimes prone to seizures, I have not seen any yet. Children with this disorder seem so different from one another, ranging in how severely they are affected by ACC. My daughter has made very little progress in many areas, and the majority of people who work with her, myself included, are very frustrated by how little information is out there to work with her and get through to her. I know my daughter is very frustrated, like she is trapped.

At times she looks like she understands what is being said to her, but she cannot act on it. At times she makes progress and then takes several steps backwards. I wish I knew how to find the key to be able to open that door. If there is any information on where I can look, I would be very grateful. We have already contacted the ACC Network, and gotten information from several Web sites.

—G. Wortmann via EP Web site

Instant S&R

Catheterization in spina bifida: timed vs. ultrasound-based

I am a physician assistant in family practice. I have a patient with spina bifida who has an "Indiana pouch" to provide urinary continence. He "self-caths" on a scheduled basis and has chronic bacteriuria (bacteria in his urine). His urine cultures are almost invariably "swarming" with Proteus mirabilis or E. coli. I am concerned that the repeated self-cath contributes to the bacteriuria and multiple urinary tract infections. I approached his urologist about changing to ultrasound based catheterization but she adamantly refused this, informing me that this could worsen his urinary tract problems and even contribute to reflux and kidney damage. I assume that she is right but I would be extremely grateful to hear from anyone with experience in this area.

—150 via EP Web site

Maybe the problem is something simpler. Many individuals with spina bifida display allergies to latex among others. Is the catheter latex? Another option would be to use "diapers" which the individual changes himself. This has cleared up infection problems with others.

THE MELMARK SCHOOL

2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

Our approved private day and boarding school serves children ages 5-21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Acquired Brain Injuries
- Cerebral Palsy
- Mental Retardation
- Neurological Disorders

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK Ext. 636 or email admissions@melmark.org

Holding a child back in school

HB (March 2002) has a son with developmental delay and wants to know the advantages (or disadvantages) of holding him back in school.

Our son is now 12 years old and in the fifth grade. When we moved from California to Connecticut, we had him repeat the second grade, feeling strongly at the time that he simply would have been "swallowed up" in third grade. Today, we know we made the right decision. David has been diagnosed with NLD/Asperber traits and is small and socially immature. He also has some difficulty with math and reading comprehension.

Holding David back has given him a little extra time to grow—something more people should consider instead of rushing their kids through school.

The only disadvantage is your child will be one of the oldest in the class—something which is really no big deal at all.

Follow your heart and do what you feel is right for your son.

—K.E., Connecticut

Support Group for Tetrasomy or Pentasomy X

Tetra-x-list (http://www.tetra-x-list@yahoogroups.com) is an online listserv support group serving families and individuals dealing with tetrasomy or pentasomy X (as well as triple X/tetra X and tetra X/penta X). The group also links families who do not have access to e-mail by keeping a database of addresses. In existence since February 2000, Tetra-x-list has 50 online group members and 20 additional offline.

The goal for Tetra-x-list is to provide support, share information about these disorders, provide links to other local resources, identify and help as many people as possible with the disorders, and eventually support more research on the syndromes. The group will also provide help to families who aren't interested in joining.

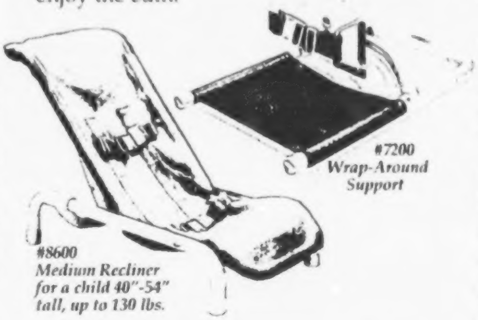
Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

☐ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

#5800 Hi-Back Positioning Commode for junior adults

☐ At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child – and you – to enjoy the bath.



#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

☐ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.

#2000 Car Seat

Why do these products work so well?

Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

UCP FOUNDATION REPORT ON OXYGENATION RAISES COMMENT

To the Editor: I want to commend you on printing the UCP Foundation Report on the potential role of oxygenation therapy in the treatment of brain injury (March 2002, pgs.64-65). This is a very comprehensive report and excellent information is made available. I would like, however, to comment on some of the statements made.

There was a suggestion that idling neurons in the brain are somewhat of a fantasy. This concept has been well-documented in the literature by Astrup, et. al., in Stroke in 1981, wherein the ischemic penumbra was first described. This was further documented clinically in an article published in The Lancet in 1990 and is well-known in academic medicine in neurology. Certainly, dormant idling neurons may recover spontaneously, as the rare patient may awaken from coma after a number of years; such a patient certainly did not grow new brain cells. The single photon emission computerized tomography (SPECT) scan, although mentioned not to be a metabolic imaging process, is metabolic because the tracer crosses the blood brain barrier. The PET imaging is excellent, extremely expensive, and not routinely covered by insurance for neurological problems. We have done both PET and SPECT and find a marked similarity.

The article also states that the McGill results were identical utilizing 1.75 ATA (atmospheres) 100 percent oxygen and 1.35 ATA air. I have discussed this fully with Dr. Pierre Marois, the chief investigator. The more serious cases were in the oxygen group and responded much faster than any of the cases in the air group. This does not mean, however, that 1.35 ATA air may not play a significant role in the treatment of cerebral palsy and brain injuries in the future. This observation is synchronous. Consider the hundreds of thousands of children who could never get to, or afford, a hyperbaric chamber. To pressurize a schoolroom at 1.35 ATA for one hour, twice a day, is a very reasonable, simple phenomenon. There are no explosions or ear problems. This is a remarkable finding and it should be explored.

I am very pleased to see that the UCP Research Education Foundation is attempting to make arrangements to investigate further the use of hyperbaric oxygenation and, possibly, pressurized air, which boosts the oxygen content to 27 percent. It is obvious that plain oxygen, per se, is of little value since it has been around for years and its use either by canula or mask has not made a great

We encourage letters on any subject. Send them to: EP Magazine, Attn: Letter to the Editor, 65 East Route 4, River Edge, NJ 07661; Fax: (201) 489-0074; or E-mail: epedit@aol.com. Zooperb.

Kids love the Monkeys, Cats, Penguins, and other creatures in this line of unique and extraordinary therapeutic equipment.

Distributed exclusively by Bodypoint Designs, Jenx™ has created a revolution in the evolution of children's positioning therapy. These new "species" of superb therapeutic tools help children stand, enhancing play and interaction with their peers. Designed for children aged 9 months to 7 years, they bring the support needed to their bodies, as well as a smile to their souls.

So, next time you need to position a child for success, introduce them to Jenx. Zooperb in every way.

impact in the treatment of these young children except in very acute phases where surface oxygen has proven invaluable.

An article by Dr. Zarabeth Golden, et. al., in the International Journal of Neuroscience, "Improvement in Cerebral Metabolism in Chronic Brain Injury after Hyperbaric Oxygen Therapy", expresses improvement in cerebral metabolism in chronic brain injury after hyperbaric oxygenation therapy. This represents a statistical analysis of changes in blood flow and metabolism in the clinical setting. There is an 85 percent correlation between these changes and the patient's overall neurological status.

According to stringent US scientific standards, double-blind crossover control studies are mandatory before something becomes acceptable. I need to point out that only 17 percent of all Medicare and insurance-reimbursable conditions have been so studied. Appendectomy, coronary bypass surgery, penicillin, lumpectomy in breasts and many surgical procedures have never been studied in this fashion. Certainly, further investigation of hyperbaric oxygenation for cerebral palsy and brain injuries is warranted, but in no way should the potential improvement of any child be jeopardized for the sake of science.

Richard A. Neubauer, MD, Medical Director
Ocean Hyperbaric Neurologic Center,
Lauderdale-by-the Sea, FL

"NOTICEABLE DIFFERENCE" GAINS NOTICE

To the Editor: "On Noticing A Noticeable Difference" (Editor's Desk Feb. 2002) was an excellent editorial! The frustration with pediatricians who dismiss parents' concerns about their child's development is widespread.

In my own experience, my pediatrician repeatedly dismissed my concerns about my child's delays for more than two years. When my son hadn't started to talk by age 30 months, all that was suggested was a hearing test. It turned out he had autism. If the pediatrician hadn't been so quick to dismiss my repeated concerns, my son could have started early intervention at a younger age, which might have helped him develop to his full potential.

Some delays may be safely dismissed, but I don't see any harm in doctors' ordering tests. If things turn out normal, fine. If not, early intervention can have lifelong benefits for the child. The "let's wait and see" or "let's take a look at that in six months" approach seems outdated in today's society when there are so many resources available to children with disabilities. These resources need to be applied as early as possible in the child's life to provide the greatest benefit.

RESPONSE TO ARTICLE ON "WHAT'S WRONG WITH TIMMY?"

To The Editor: After reading every other article in the November 2001 EP ("It All Begins in the Home," pgs. 60-61), I finally mustered up the courage to read the story about Maria Shriver and her new book, What's Wrong with Timmy? I am not proud to say it, but I have been angry with Maria Shriver since her book came out. Why? I saw a portion of her interview with Tim Russert on CNBC in which she

continued from page 23

talked about her book and why she wrote it. In the end, Tim and Maria both suggested that parents of children with special needs should be thankful for what they are given and love their children. This angered me greatly for several reasons. The first of which was: How dare they tell me what I should feel? Do they have a child with special needs? Are they driving numerous hours every week to take their child to physical, occupational and speech therapies? Do they have to travel to a different state to get care from a specialist? Do they have to keep a notebook full of various test results in order to give the doctor all the information needed? Do they have to be just as learned as their physician to ensure the best treatment for their child? Do they have a "normal" child who is jealous of her sibling's getting all the attention? Does that "normal" child feel she needs to wear a brace to be noticed, even when you think you have done everything in your power so she does not feel left out?

When we named our son Timothy, we did not know that he had special needs! We did not know that he had experienced a stroke during the first trimester of my pregnancy. And we didn't name him so that he could be compared to a character in a book.

I think the article about What's Wrong with Timmy is wonderfully written. I agree that "normal" children should play with special needs children. I am thankful for the schools' mainstreaming our special children with normal children. I am thankful for my son Timothy! I am angry, however, that I didn't know Timothy had a stroke while I carried him and that I could not help him. I am sad that he has to endure braces, therapy and botox injections. I am sad that he is self-conscious of his silly run, his stuttering and the fact that he is different from others. I am tired of people telling me how I should feel. And if one more person tells me that God does not give us more than we can handle—or some twist to that same phrase—so help me I will scream!

To steal a line from Ms. Shriver, "What is wrong with Timmy? Nothing, nothing at all!"

Gretchen Gibson, Jenks, OK

(The writer and her husband, Craig, are the parents of Timothy, Elizabeth and Miranda)

EDITOR'S NOTE: According to the transcript of Maria Shriver's interview on *The Tim Russert Show*, which aired on CNBC on October 20, 2001, Ms. Shriver said: "...Everybody you talk to, who talks about finding out about their child having a disability relays this kind of experience: the loss of dreams that they may have had for their child; the fear that's involved with this and then the learning to love the child that they actually have been given by God. And that's the challenge for all of us, as parents, is to love the child we have, not the child we think we wanted to have or the child we dreamed of having." Ms. Shriver has been very involved with the disabled community. Her mother, Eunice Kennedy Shriver, started the Special Olympics and has a sister with disabilities. Informed Parents

Where Parents Keep Up To Date On Products For Their Children's Special Needs

The Gator Complete

GATOR

FUN Fact

All Supports From the Gator can be removed once the Walking Skills are Learned

Gator Standard
Comes with Adjustable Handle Bars, Bicycle Grips, Rear [illegible], and Anti Reverse Wheels with Caster Pin Locks.

When the Snug Seat product development team asked therapists and parents what they wanted in a gait trainer, they were told to concentrate on three areas.

Construct a product that will expand as the child grows - "this will save us money", Create a noise free product -"You can hear my child a mile away in other gait trainers", and use quality casters to make it easy to operate - "those tiny casters get caught in cracks and are difficult to maneuver over thresholds"

The revolutionary design of the Gator has allowed us to meet those objectives and many more. Our unique frame design provides built-in growth that requires the purchase of two competitive units. We are able to accomplish this feat with our unique width and height adjustable hand-grips and forearm supports.

Gator Complete
Shown with Arm Troughs, [illegible] Seat Ankle Supports, Pelvic Pad, and [illegible] Supports

The Gator's strong steel frame is made to last and eliminates the squeaks and creeks of competitive units, and our large swivel casters are easy to steer for even the most fragile child. We also provide caster pin locks as a standard feature.

Citizen Circle K:

CORPORATE COMMITMENT to People With Disabilities

By Paul T. Burke

UCP
Understanding Disabilities Creating Opportunities

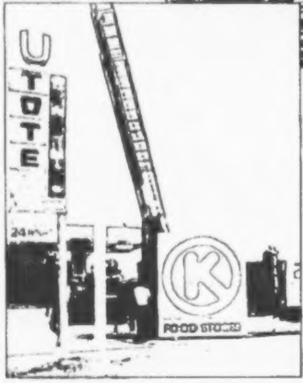
In the 1950s, America witnessed a phenomenon that it had not seen before in retail marketing – the advent of convenience stores. At first, these stores were open from early morning until just before midnight. They reflected the public's growing desire to be able to purchase basic commodities quickly and inexpensively in a highly mobile post-World War II society. Milk, soda, beer, coffee and cigarettes were the commodities in principal demand.

In many cases, the names associated with these convenience stores expressed the colorful diversity of America. In the Southwest, a chain of stores named Utotem was among the most popular. Like similar enterprises throughout the United States, this chain provided quick service to a mobile constituency in a hurry. In 1984, Utotem was purchased by Circle K, and its stores subsumed into a network of more than 2,400 convenience stores nationwide. Today, Circle K stores are also part of many Mobil Oil service stations on major highways.

Fast, friendly and clean stores were and remain a cornerstone for success. From the start, Customer Service Representatives (CSRs) learned to build rapport with customers who were in their stores for less than five minutes, seeking to make quick and inexpensive purchases from a multitude of categories. A cheery smile and helpful attitude—borrowed from a time when general stores served America—meant success in the convenience store business.

Good interpersonal skills translated into customer loyalty. Store managers also sought to establish their enterprises as places that made major contributions to the communities they served. The occasion of a customer being in a store for a short period of time with spare change from a recent purchase lent itself to an instant contribution opportunity. And so the Circle K – United Cerebral Palsy (UCP) relationship was born.

UCP is a nationwide network of more than 110 community-based affiliates that provide services to families and caregivers of infants, children and adults with disabilities. The direct services provided by UCP affiliates range from medical treatment to employment and social programs. Every year more than one million people with cerebral palsy and other disabilities receive assistance from UCP affiliates in 39 states. Interestingly, more than 65 percent of the people served by UCP have a disability other than cerebral palsy. Through the years, UCP has become a leader in the disability field, and is consistently ranked as one of America's most financially responsible charities.



Circle K's relationship with UCP started at a simple backyard barbecue. Gradually, Circle K stores began collecting coin donations from customers, sending the donations to UCP. Today, the Circle K brand of convenience stores continues a tradition of support that began in 1984 when The Circle K Corporation purchased the Utotem chain of convenience stores. After the acquisition, Circle K management adopted UCP as the company's charity-of-choice. To date, the nationwide network of Circle K convenience stores has raised more than $36 million for UCP through coin canister collections and special events.

Lead Customer Service Representative Anna Hall asks customer if he would like to donate his extra change to the UCP canister collection program.

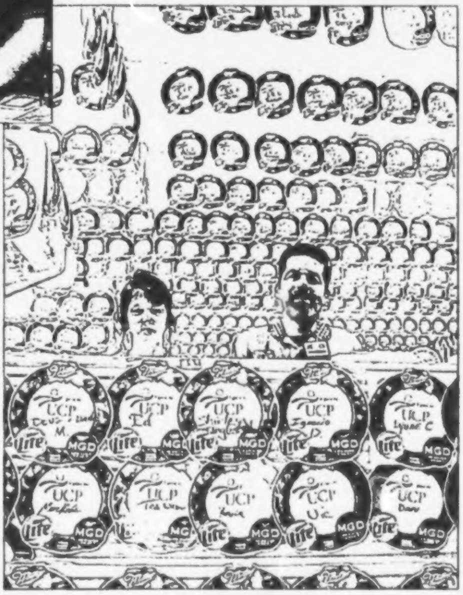
The most visible Circle K fundraising program is the annual holiday promotion in conjunction with Miller Brewing Company. Every November and December, Circle K customers are invited to make a one-dollar donation in exchange for recognition on a paper holiday wreath. Each personalized wreath is then displayed on Circle K walls throughout the holiday season. This successful program raised more than $500,000 in 2001.

But the Circle K store employees who meet the public on a daily basis are the heart and soul of this incredible philanthropic movement. They are committed to doing their share to support the independence of people with disabilities. As Lead Customer Service Representative Anna Hall says, "I have met children and their families that have been helped by UCP and my heart has been deeply touched . . . I truly believe in this [UCP canister collection] program."

Wanting to be part of something larger than oneself and finding a way to help others are uppermost in the minds of many Circle K employees. "Our employees have great heads for business, large hearts for people," says Mick Parker, manager of company operations for Circle K. "We're very proud of them." Circle K District Manager Ardie Killion confirms that appraisal in her description of outstanding UCP fundraiser Linda Reynolds, "Linda has been the number one collector of UCP funds in the company for the past five years. There is no other employee in the company that is as dedicated as this lady."

Another store manager, from Circle K's southern region (encompassing Louisiana, North Carolina, South Carolina, Georgia, Tennessee, Virginia and New Jersey), has this appraisal of employee Trudy Parmeter: "Trudy has been employed by Circle K for nine years, and devotes most of her time to UCP fundraisers and events. Not only does she work full-time and go to school full-time, but she is a mother of three children . . . for the past two years, she has promoted car washes and food drives to benefit UCP."

Circle K's Albuquerque, NM District Manager Tom White has this to say about Hazel Phillips: "Hazel is 75 and never lets up – she asks customers every day to donate to UCP. Hazel also has raised the performance of her fellow employees by her example."



During the annual holiday fundraiser, customers donate $1 to UCP to have their name placed on a paper decoration and hung within Circle K stores nationwide. Store #1966 sold an outstanding 2,998 paper decorations during the two-month promotion.

"Leadership by example is the key for this tight-knit company and its compassionate employees, who think of others first while serving the public in their communities," says UCP National Volunteer President E. Hal Nolan. So the next time you rush into a Circle K, in a hurry, to pick up that soda or loaf of bread, pause for a minute and look at the smiling face that asks you to share your change to make a difference in someone's life.

UCP Executive Director Kirsten A. Nyrop adds: "Citizen Circle K is a shining example of how corporations, employees and responsible charitable organizations can really make a difference in the lives of the people they serve while still upholding and accentuating the company's mission!" **EP**

Paul T. Burke is the director of marketing and communications for UCP.

THE SURGEON GENERAL FOCUSES THE NATION ON Health and Mental Retardation

Duane Alexander, MD
Director, National Institute of Child Health and Human Development

When Surgeon General David Satcher called for a national conference on health and mental retardation (MR), he made it clear that he wanted to bring together "experts, and especially parents...and persons with mental retardation...to talk about what we know and what we do not know." With this pledge at a March 2001 congressional hearing, he launched an extraordinary process that led to the publication, in February 2002, of the report of the first-ever Surgeon General's Conference on Health Disparities and MR.

The new report, *Closing the Gap: A National Blueprint to Improve the Health of Persons with Mental Retardation*, is based on the findings and recommendations of the December 2001 conference, held in Washington, DC. The report draws attention to the health and healthcare needs of people with MR. In recent years, public policies have tended to focus less on their health than on deinstitutionalization, community living, education and employment. Although more precise data are needed, there is convincing evidence that people with MR are less healthy and more likely to miss out on appropriate healthcare than others without this condition.

The report states six broad goals to enable children, adolescents and adults with MR to live healthier lives with the support of their families and communities. It offers specific action steps and potential strategies for moving toward the goals. It also presents thumbnail sketches of several promising programs that now provide general and specialized healthcare to people with MR living in the community. And the report suggests many potential partners, from families to local, state, and national agencies and organizations, that could work together on action steps and strategies.

> The report states six broad goals to enable children, adolescents and adults with MR to live healthier lives with the support of their families and communities.

According to Eunice Kennedy Shriver, longtime advocate for people with MR—she received the Surgeon General's Medallion from Dr. Satcher at the conference—the December meeting was the first to be devoted exclusively to the health of people with MR. As the meeting began, researcher Sharon Ramey said, "I've waited thirty years for today." After the conference, Kim Daniels, a parent consultant to the Vermont Self-Determination Project, wrote that as the conference progressed, she felt years of frustration and anger being replaced with hope.

The publications of the Surgeon General can be catalysts for action at every level of society. For example, since the first Surgeon General's report on smoking and health, in 1964, there have been sea changes in attitudes toward tobacco of policymakers, healthcare providers and the American public. As the smoking story suggests, progress on a health issue can be both widespread and sustained when initiated by a Surgeon General's report. "People respect these reports and act on them, especially when they deal with a topic as important as health disparities and MR," Dr. Satcher told the conference. He urged participants to start the process of change in their own communities. "Together, we must move these issues to the front of the American health agenda," he said.

Why pay special attention to health and MR? "MR" is one term for a cluster of specific disabilities that vary in intensity and that affect learning and

Material contained in this report is in the public domain and may be used and reprinted without special permission; appropriate citation to source should read: Reprinted from EP Magazine, 65 E. Rte 4, River Edge, NJ, 07661; (800) 372-7368; web site: http://www.eparent.com.

THE GOALS OF *CLOSING THE GAP: A NATIONAL BLUEPRINT*

TO IMPROVE THE HEALTH OF PERSONS WITH MENTAL RETARDATION

1. Integrate health promotion into the community environment of people with mental retardation. Action steps address educating and supporting individuals with MR and their families and direct support professionals (DSPs) in self-care and wellness, care burdens on families, turnover among DSPs and protection from occupational hazards for people with MR.

2. Increase knowledge and understanding of health and MR, ensuring that knowledge is made practical and easy to use. Action steps address participation of the community of people concerned with health and MR in identifying research priorities, a national research agenda, data collection, protection of research subjects, understanding and use of research findings, research capacity and visibility of health and MR research.

3. Improve the quality of healthcare for people with MR. Action steps address priority areas for healthcare quality improvement, standards of care, the role of practice, organization and financing of healthcare services in quality improvement and recognition of excellence in provision of healthcare to persons with MR.

4. Train healthcare providers in the care of adults and children with MR. Action steps address basic and specialized training of healthcare providers, continuing education for established providers, interdisciplinary education and training, and provider competencies.

5. Ensure that healthcare financing produces good health outcomes for adults and children with MR. Action steps address relationships among healthcare financing, service packages, outcomes and accountability, definitions of "effective" and related terms in research, the organization and financing of healthcare, access to appropriate packages of services, leveraging health dollars for maximum purchasing power, and offsetting specialized costs to healthcare providers in extra patient time and other factors

6. Increase sources of healthcare services for adults and children, ensuring that healthcare is easily accessible for them. Action steps address the numbers and diversity of trained and experienced healthcare providers, complexities in access to health services, community-based healthcare, allied health professionals, supportive services for providers (e.g., case management), specialized equipment at clinical sites and continuity of care across the lifespan.

acquisition of particularly complex adaptive skills. There is no single, generally-agreed-upon term for this type of disability, which is also called "intellectual disability," "cognitive disability," "developmental disability," and other specialized terms. For most people with MR, the condition is mild. With appropriate support they are able to live, go to school and work in their communities.

Like anyone else, people with MR need primary care and specialized health services that are family-centered, easily accessible, responsive to their cultural values, and appropriate for their medical condition, their age and their personal goals. Such care can be exceptionally difficult to find in most communities. As one conference participant said, "There are many benefits of deinstitutionalization, but having resources in the community has not been one of them."

In part, the difficulties of people with MR and their families are those that other vulnerable populations are also likely to encounter. For example, according to reports of parents and primary care providers and data presented at the conference, many doctors, dentists and other providers believe that Medicaid reimbursement rates are inadequate and program rules too complicated. For these reasons, they may restrict

Laura and John Noble and sons Jeffrey and John participate in Operation HouseCall (see p. 30).

OPERATION HOUSECALL: BOSTON PARENTS TEACH MEDICAL STUDENTS ABOUT SPECIAL NEEDS CHILDREN AND THEIR FAMILIES

Stories about doctors and other practitioners – every parent of a child with special healthcare needs has them. There are doctors who talk directly to children – even those who do not answer verbally – and who easily share information and decision-making. But there are also doctors like the one who did not talk to Susan Nadworny about her infant son's seizures. "All of a sudden, twelve people trooped into the room, " she recalls. "And they said, 'This is your epilepsy team.' And that's how I found out his diagnosis."

To help future doctors better recognize family needs and strengths, Susan now coordinates specialized training for third-year students at Boston University School of Medicine (BUSM). The training, "Operation HouseCall," sends students for extended visits to homes of children with special healthcare needs and their families.

Before their visits, students are often apprehensive and concerned that they will be intruding upon families. Susan assures them that families are eager to introduce the students to their children, and to help them understand that children must be treated as part of the family unit. After the visit, says Susan, the students' "fears are allayed and they really appreciate the visit." According to a study published in 1998, the training is associated with measurable, positive changes in students' attitudes toward children with disabilities and their families. Students overwhelmingly said that they found the training useful.

Participants in the Surgeon General's Conference on Health Disparities and Mental Retardation, held in December 2001, heard about the program from Boston neurologist Dr. David L. Coulter. The program began about ten years ago, after the Greater Boston Arc (GBArc) approached the medical school about improving physicians' attitudes toward people with mental retardation. Dr. Coulter worked with GBArc in developing Operation HouseCall, now overseen by Dr. Benjamin Siegel, director of medical school education and pediatrics at BUSM. "This started with the parents, not us," Dr. Siegel says. From the start, parents have designed the curriculum and taught the students.

Volunteer families. Sixty families of children with special needs currently volunteer to invite medical students into their homes for visits lasting about four hours. Their children range in age from preschool to young adults. Often, but not always, their disabilities are cognitive. Susan coaches the families about the medical student visits. She tells them that the students are not visiting to provide care to their children. Instead, "They're here to ask questions. They're here for you to teach. Think about the message you want them to leave with."

Classroom education. Every six weeks, as each pediatrics rotation begins, Susan meets with the students on the rotation for a two-and-a-half-hour orientation. She begins by asking about their knowledge and attitudes about disability. She asks them to think about how they would prefer to be told if they had a child with a disabling condition. She illustrates her talk with her own experiences. When she first saw her newborn son, she recognized that he had Down syndrome, but her physician said only that they had suspicions.

Susan's talk takes students through the lifespan of a person with disabilities, from infancy and early intervention to school, adolescence, the transition to adulthood and concerns of aging parents about their adult children. She discusses legal rights, special education and community resources. She shows videos: one takes students into an inclusive school classroom; another describes needs of elders and families.

Students receive a packet of handouts, the first a welcoming letter from Susan. The packet includes a short list of questions that students could ask to get conversations going with parents. Other handouts list web sites where students can learn quickly about the condition of the child they will visit, and translate common acronyms, such as "IEP," into English – "Individualized Education Plan." One handout is a candid list of "dos" and "don'ts" for students to remember when they visit with families. They are advised, for example: "Do say, 'I'm sure you will do what's best.' Do say, 'I don't know,' when you don't."

Home visits. Host families structure the home visit, which often occurs at dinner time but may be a trip to a park or an evening talk with pizza. The primary goal of the visit is to help students understand how a child's disability affects a family— "and to see how the child is a member of the family, and needs to be respected," Susan says.

Student evaluations. At the outset of the training, students fill out profiles that indicate their knowledge and attitudes about disabilities; after the visit, they write about their experiences.

According to Drs. Siegel and Coulter, Operation HouseCall is a low-cost, effective way to shape student attitudes while their "medical personalities" are still being formed. Demands on student time are minimal and Susan's work is supported by a small grant. They have several suggestions for parents who would like to start similar training programs in their local medical schools. First, it is important to have a faculty champion within the school. Second, the school must "legitimize parents as faculty." For example, the Boston medical students are advised that they must complete scheduling their home visits in the first two weeks of their pediatrics rotations. The penalty for missing the deadline is an automatic low grade on a student's academic record. A third strategy would be to frame the program as a way of teaching students about working effectively with patients, whether or not they have disabilities.

The curriculum for the Operation HouseCall training, including the information packets provided to the medical students and a video prepared for medical school faculty, are all available from Greater Boston Arc. Anthony Sirignagno, Director of Advocacy and Community Services at GBArc, says that more than 100 medical schools have contacted him about the training, and that it is currently being used at about a dozen schools. To request the curriculum materials and the video, contact Greater Boston Arc, 617-783-3900, gbarc1@msn.com, or www.gbarc.org.

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing, can, even in a small way, change a child's way of life.

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Pull-Ups
GoodNites
DISPOSABLE ABSORBENT UNDERPANTS
45 lb & over

For Better Days.

Imagine your child gaining a little more independence just by a change in clothing. For information on how GoodNites can help, and a free sample offer, please visit us at www.goodnites.com/offer

the number of Medicaid recipients in their practices, or refuse to accept these patients at all, regardless of disability or medical condition. Such restrictions make the providers inaccessible to the estimated 60 percent of people with MR who rely on Medicaid as their only source of healthcare coverage.

And for people with MR, there are additional challenges in staying healthy and getting satisfactory care. Healthcare providers rarely receive the type of training that would enable them to feel competent in treating and interacting with people with MR. Dr. Kathleen Braden, a Massachusetts-based developmental pediatrician, identified a number of promising programs—summarized in *Closing the Gap*—that accommodate the special needs of people with MR. Dr. Braden says it takes special skills to distinguish among cognitive disability, symptoms of depression and, for example, attitudes and behaviors that are common in adolescence. "Some providers still cannot see beyond the disability to the person," notes Dr. Braden. According to some providers, community mental health centers may exclude people with MR. Such exclusions may reflect mistaken beliefs that children, adolescents and adults who are cognitively challenged cannot benefit from psychotherapy and counseling.

Susan Nadwomy coordinates Operation HouseCall and is the principal trainer. Their experience when son James (r) was born prompted Susan and husband John (c) to become involved with the program.

As the programs summarized in *Closing the Gap* suggest, good results can be expected when healthcare is attuned to the cognitive abilities of people with MR. This is particularly true of programs built on principles of individual autonomy and self-determination. One conference participant urged better dissemination of information about existing, community-based health services. "There are many

Elizabeth Kipstein (l) and mom Patricia Kipstein (r) help train third-year medical students to recognize family needs and strengths through Operation HouseCall.

continued from page 32

good programs out there. Let's take the best of our good ideas and not start at square one when we try to help people."

There also is published evidence that with appropriate training, especially before they enter practice, health professionals can learn to see and value the person, rather than just the disabling condition. "Our people coming out of medical school are our best hope," according to Boston neurologist David L. Coulter, MD.

How was the *Closing the Gap* report developed? In planning the conference, the Surgeon General asked the public to submit comments to a special web site; he also listened to comments at the nationally videocast listening session in October 2001. The result was hundreds of written and verbal comments from self-advocates with MR and their families, primary and specialized healthcare providers, researchers, program administrators and others concerned with health and MR. These comments helped to identify eight major issues for the conference to address, ranging from provider attitudes toward people with MR to the quality and financing of their healthcare, their access to services, and their role in staying healthy. (The listening session is summarized in *Closing the Gap.*)

The conference began on December 5 with presentations of existing data and research needs for each of the eight issues. These were coupled with descriptions of health programs that address some of the issues. Then the 160 conference participants met in small work groups to identify high-priority issues, develop action steps, discuss research and resource needs and identify potential partners to help in implementing ideas. Joseph M. Valenzano, Jr., President, CEO & Publisher of EP and Rick Rader, MD, Editor-in-Chief, were among the invited participants.

Satisfaction Guarantee/Lifetime Warranty

Work group membership mirrored the diversity of the conference as a whole. According to one moderator, members of her group "ranged from the executive director of the Daniels household to the parent of a child with ADHD, a member of the Sioux tribe, the deputy director of the Arc and a Social Security wonk. and all of these folks came together in diversity, to unite around certain core values." On the second day of the conference, moderators presented highlights of their group's chosen issues and recommendations; additional suggestions emerged in discussions at the full conference.

In drafting the report, the biggest challenge was finding the best way to capture the hundreds of ideas and suggestions that bubbled up in conference sessions and work group discussions. "We had 28 issues. We could have had more," said one group moderator. In scale, ideas and action steps ranged from realigning Medicaid, to make it more responsive to outcomes of importance to people with MR and their families, to surveying a single doctor's practice, to asking families of children with special healthcare needs about arrangements that would make office visits easier. In one work group, a parent suggested a way to solve a research problem that had challenged academic investigators. In describing her group's discussions, psychiatrist Roxanne Dryden-Edwards told the conference, "I can't say how much I've learned" from parents and self-advocates. "They may need us, occasionally, but we professionals need them."

What can exceptional parents do? The goals, action steps and potential strategies of the new report are ambitious and wide-ranging. Research agendas are called for. Better financing of healthcare services is recommended. Community support to protect the

Universal Newborn Screening

In 1961, Dr. Robert Guthrie of the University of Buffalo developed a laboratory test to detect phenylketonuria (PKU) in newborns. PKU is an inherited metabolic disorder resulting from an enzyme deficiency; if left untreated, it results in profound mental retardation. In 1963 Massachusetts became the first state to mandate screening for PKU, which can be treated by lifelong dietary management and counseling. The National Association for Retarded Children (now The ARC), the Children's Bureau and the Kennedy Foundation were foremost among the organizations that pushed for widespread adoption of the Guthrie test, and by 1966 it was required for all children by all 50 states and the District of Columbia.

Dr. Guthrie and other researchers continued to develop newborn screening (NBS) tests to detect many more disorders, and each state decided what screens would be available for its newborns. Significant disparities resulted; in 1997, in Massachusetts, infants were tested for 10 or more disorders, while Utah's babies were screened for three. Montana and South Dakota each mandated three tests and offered one other by special request only. In the same period, with the introduction of ever-smaller and more powerful microprocessors, technology and equipment became significantly more sophisticated. This permitted testing that had not been feasible before. A process called tandem mass spectrometry (tandem MS, MS/MS) can now run tests for nearly 40 disorders at one time. None are curable, but all are treatable.

In the last two years, many states have expanded their NBS programs. Almost all Pennsylvania hospitals now offer the full spectrum of testing, although the law mandates testing for only six. Massachusetts routinely screens for more than 15 disorders and is running a pilot program offering 30+ tests. Wisconsin has almost tripled availability, from 7 tests to 20. Yet universal NBS still engenders much controversy, and there are many issues to be resolved before consensus can be reached on how the US will move forward.

ISSUES: These may be economic, political, professional, sociocultural, religious. Capital spending, training, payment policies, long-term follow-up; insufficient hard financial data; union issues; professional knowledge levels and practice habits; citizen knowledge, and cultural and religious beliefs and practices; insurance, managed care companies, Medicaid, ChIP programs, the uninsured—all these and many more must be part of discussions and resolution.

With the current system, a child born in Louisiana with galactosemia will likely live a life marked by mental retardation and other special health care needs, while similarly affected children born the same day in most of the rest of the country will receive immediate treatment and become productive members of society. The data tell us that of the four million babies born in the US each year, ten to twelve thousand will have one or more of these detectable disorders, an almost-negligible number. The overall cost or benefit to our society, though, will vary wildly from one child to another because of the patchwork of screening availability. We as a nation must find a way to embrace universal NBS and make it routine for all children born in the US. More than that, it is downright wrong not to do so when it has proven its worth time and again!

It is a question of education and awareness. Research shows that the average couple planning to have children does not know anything about existing screening programs, much less the capabilities offered by tandem MS, largely because OB/GYNs, pediatricians, genetic counselors and related professionals are not familiar with universal NBS. The education gap relates to professionals and consumers, rich and poor, people of every race, religion and ethnicity. Few people know much about any of the issues. Worse, among the people who do profess knowledge of NBS and the issues, a good deal of what they "know" is wrong.

The data tells us that of the four million babies born in the US each year, ten to twelve thousand may have one or more of these detectable...and treatable...disorders

health of people with MR is suggested. Individualized health planning across the lifespan of an individual with MR is urged. And core values, applicable to all report recommendations, are framed in quotations from conference participants. Perhaps the most pervasive value, as expressed by one participant, is that there must be "coordinated, community-based services that are integrated, available and accessible. Let's not make it all so difficult."

Threaded throughout the report are the insights and ideas of the family members and self-advocates who joined with professionals in the work group decisions and floor discussions of the full conference. Dr. Dryden-Edwards described the experience of one mother in her group, whose 6-year-old child had participated "in as many research protocols as he is old." The group agreed that the impact of these experiences on the child and family should be part of the design of research projects.

In several groups, parents and physicians, nurses, physician assistants and other clinicians described their needs for easy access to scientific literature in lay language, which addressed areas of concern to them. In *Closing the Gap*, these experiences translate into a goal, not only to "increase knowledge and understanding of health and MR," but also to "ensure...that knowledge is made practical and easy to use." Among the action steps and potential strategies of this goal are enabling family members to

involved in research by including them in advisory committees and helping them understand how to frame research questions and other technical issues.

At the end of the conference, Dr. Satcher charged participants to use the forthcoming report on the conference recommendations as a resource. Self-advocate and Special Olympics athlete Loretta Claiborne concluded that "The consensus of this conference is to take action–and I really mean action." EP

With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler***.

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Please visit our Worldwide Web site at www.redbarn-enter.com for additional details and a video demonstration of the ***Creepster Crawler***.

Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002
LOCATION:
Orange County Convention Center—Orlando, Florida

A UNIQUE GATHERING—A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract **physicians** ◦ **families** ◦ **direct support professionals** ◦ **people with disabilities** ◦ **allied health care professionals** ◦ **educators** ◦ **adapted physical education specialists.**

TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more.

EMPLOYMENT SYMPOSIUM PAVILION: Human resource managers will discuss career opportunities.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.

CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment. (See next page for complete program).

- CME and CEU accreditation will be provided through approved accreditation institutions.
- An Employment Symposium produced in conjunction with the Florida Department of Education, Division of Vocational Rehabilitation Services will offer sessions for people with disabilities, their families and employers.

EP5/02

October 3-5, 2002 • WORLD CONGRESS & EXPOSITION ON DISABILITIES

SOMETHING FOR EVERYONE: THE WCD CONFERENCE PROGRAM

The third annual World Congress & Exposition on Disabilities (WCD), produced by H.A. Bruno, LLC, will feature over 150 multi-disciplinary educational sessions developed by the EP Foundation for Education, Inc., a 501(C) 3 not-for profit organization, with the assistance of EP Exceptional Parent Magazine and supported by the Academy of Pediatrics, the National Institutes of Health, the Child Neurology Society, The Association of University Centers on Disabilities (AUCD), WE MOVE and other professional societies and organizations. An extensive adapted physical activity program, sponsored by PALAESTRA Magazine, will again be offered. Each session is designed to educate many disciplines within the disability community. During the intensive three-day educational experience, information and ideas on today's most important issues will be exchanged between people with disabilities, their families and caregivers, physicians, direct support professionals, allied health care professionals, educators and adapted physical education specialists. The conference will take place October 3-5 at the Orange County Convention Center in Orlando, Florida.

"That event (the World Congress & Exposition on Disabilities) was magnificent. You have a subgroup, a session, for every subject under the sun. It's the most comprehensive educational program I've ever seen in any one setting," stated Florida Governor Jeb Bush, a scheduled Guest Speaker this year in Orlando. In addition, the WCD conference program is collaborating on a 50 session employment symposium with the Florida Department of Education, Division of Vocational Rehabilitation Services (VRS) and other statewide provider/advocacy organizations, sponsored by VRS and McDonald's Corp. See upcoming issues for updates on employment symposium titles.

The 2002 session topics to date include:

WEDNESDAY, OCTOBER 2

- Physical Fun for Everyone
- The Top Down Planning Model
- The Circle of Rings-Collaboration between Teachers, Therapists and Families

THURSDAY, OCTOBER 3

- Oral Motor Patterns, Impairments and Therapy
- Pain and Pain Management Part I
- Management of Spasticity Arising Out of Central Nervous System Disorders
- The Role of the Pediatrician in Managing Great Care for a Child with Challenges
- A Web-Based Tutorial on Developing an Individualized Education Program
- Sense the Water: Understanding Sensory Integration and Skill Acquisition in Adapted Aquatics
- Therapeutic Recreation and Functional Ability of Older Adults
- Music and the Active Learner
- Adaptive Golf
- Geriatrics and the MR/DD Population
- Autism: What the Research Tells Us
- Pain and Pain Management Part II
- Teaching Empathy to MD Residents
- The Management of Dystonia and Other Movement Disorders Part I
- Seizures & Seizure Management: Brain Mapping & Surgical Intervention
- Working with Your Doctor - Keep Them on Their Toes!
- Utilizing Task Variation to Teach Motor Skills to Individuals with Autism or Developmental Disabilities
- Inclusion Strategies for Aquatic Programs
- Fall Risk Reduction: A Multidimensional Approach
- Relaxation for Students with Special Needs
- Are You Getting or Offering "State-of-the-Art" Behavioral Supports?
- More on Project DOCC Part I
- Caregivers: Caring for Others and Yourself
- The Management of Dystonia and Other Movement Disorders Part II
- Seizures & Seizure Management: Confirming Diagnosis and Assessing Treatment
- Louisiana GUMBO
- Designing and Implementing a Fitness Facility for The Physically Disabled
- Activities to Facilitate Inclusion of Exceptional Learners
- Carefully Designed Movement Activities to Facilitate Central Nervous System Development in Young Children with and without Disabilities
- When Information Is Not Enough: Using the Internet
- More on Project DOCC Part II
- A Communicative Approach Used for Autism, PDD and Aspergers
- The Management of Dystonia and Other Movement Disorders Part III
- Seizures and Seizure Management: From Febrile Seizures to Breakthrough Seizures
- In a Child's Room
- Augmentative and Alternative Communication Evidence-Based Clinical Practice Using Performance Measurement Tools
- Positive Behavioral Support in the Gymnasium: An Alternative to Behavior Management
- Radical Changes in the National Wheelchair Basketball Association's Youth Division
- Collaboration Between the Physical Therapist and the Physical Educator
- Activities to Facilitate Music and the Active Learner
- Attention Deficit Hyperactive Disorder (ADHD): Medication, Side Effects, and Physical Activity

FRIDAY, OCTOBER 4

- Transitioning: Advanced Education (Post Secondary)
- Appropriate Education for the Child with Autism: Courting the Schools and Avoiding Court
- PreVerbal and Early Verbal
- Learning Disorders and ADD/ADHD
- Universal Newborn Screening: Early Hearing Detection and Intervention
- A Parent's Story About Dealing with Mitochondrial Myopathy
- On The Road Again or For the First Time
- Adapted Physical Education in Korea
- Wake Up and Face the Facts! Parents as an Influence on Children's Physical Activity Levels
- Life-Long Involvement in Sports and Recreation for Deaf and Hard of Hearing Individuals
- Resistance Training for Individuals with Developmental Disabilities
- Challenging the Senses for Increased Balance and Postural Control in Older Adults: It's as Easy as 1, 2, 3
- Preschool Activities for Children with Disabilities
- An Adapted Aquatics Curriculum and Assessment Inventory
- Genetic Disorders and Counseling
- Language — Developing Conversational Skills in Children with Disabilities
- Universal Newborn Screening: What Is It and Why Is It So Important?
- Seizures and Seizure Management: The Ketogenic Diet
- What to Know about Clinical Trials for Rare Diseases
- A Review of Driving Technology Today
- Sport for Individuals with Mental Retardation in Eastern Europe and Eurasia
- Sign Language for Adapted Physical Activity Professionals
- Developing Rubrics for the Adapted Physical Educational Standards
- What Parents Can Do to Help Their Children Become Physically Fit
- Activities for Restricted Space
- Ai Chi Basic Class-Balance, Harmony and Healing
- Cognitive Skills and Aquatics
- Teaching Literacy (Whole Language & Phonics) to Adults with MR/DD
- Universal Newborn Screening: Detection, Screening and Treatment
- Lower Limb Prostheses 2002: Current State-Of-The-Art
- Creative Games and Activities that Use Low Cost or Free Equipment
- The Art and Science of Transfers: A Grand Collaboration
- Seizures and Seizure Management: The Vagus Nerve Stimulator
- The Spectrum of Mitochondrial and Metabolic Disorders
- Physical Fitness Programming for Individuals with Multiple Sclerosis
- Diabetes Exercise and Education Program Management
- Ai Chi Program for Children with ADD and other Neurological Impairments
- The National Alliance of Direct Support Professionals (NADSP)
- The Spectrum of Rare Disorders
- Dolphins and the Disabled
- Universal Newborn Screening: Screening Methodologies
- Women, Pregnancy and Epilepsy
- Perioxosomal, Lysosomal and Mitochondrial Disorders
- Legislation, Conformity, And Outcomes For People With Disabilities
- Inclusive Outdoor Education Programs for Students with Special Needs Part I
- Adaptive Snow Skiing
- Developmentally Appropriate Pedagogy for All Ages
- Practical Props for Special Pops
- Challenging the Senses: An Awareness of Sensory Distortions
- A Student Driven Adapted Aquatics Program

SATURDAY, OCTOBER 5

- IDEA Overview
- Realizing the Power of Choice: So Many Choices, One Goal
- Fun with Educational Math for People with Cognitive Disabilities
- Universal Newborn Screening: Why Screening is Important to Our Nation
- Overview of Veteran's and Survivors' Benefits
- Dealing with Managed Care Systems: Some Practical Perspectives on Reimbursement Issues
- Indispensable Tips, Tricks and Tools for Writing
- Darwin Was Right—You have to Adapt to Survive
- Adapted Aquatics Equipment, Programs, and Credentials for People with Disabilities
- Using Computer-Based Virtual Environments to Enchance Community Integration
- Coaching Athletes with Mental Disabilities
- Rhythmical Movement Vocabulary
- Latest Changes in IDEA: How Do They Effect Your Child
- Knowing Your Legal Rights
- Fun with Educational Math for People with Cognitive Disabilities Part II
- The Most Disability-Friendly Community in the US
- The Commercialization of Universal Newborn Screening (UNBS) Part I
- The Exceptional Family Member Program
- Ticket to Work Program
- Assistive Technology and Augmentative Communication
- Life-Long Involvement in Sports and Recreation for Deaf and Hard of Hearing Individuals
- A Cyberspace Class For Community College Adapted Physical Education: Stages of Collaboration
- Aquatics for Learners with the Pervasive Developmental Delay Spectrum: Autism, Asperger's Syndrome, PDD-NOS, and Rett's Syndrome
- Activities to Promote Inclusive Outdoor Education Programs Part II
- Adapted Martial Arts Program for those with Physical and Mental Disabilities
- Discipline and How It Affects your Child
- Estate Planning For Families Caring for People with Disabilities
- Transition From Hospital to Home: Supports and Services for Infants with Special Needs and Their Families
- Autism Spectrum Disorders: Myths and Realities
- The Commercialization of Universal Newborn Screening (UNBS) Part II
- How to Compose an Effective Individualized Education Program (IEP)
- Special Needs Trust (Community Trusts)
- Transition From Hospital to Home: Cultural Considerations
- Autism Spectrum Disorders: What We Know and What the Future Holds
- Universal Newborn Screening: The Role of Genetic Counseling
- Oral Healthcare for People with Disabilities and Special Needs Part II
- Personal Perspectives on Disabilities
- Prevention and Treatment of Skin Injuries Common to those with Amputations Participating in Adapted Physical Activity
- SCUBA Diving For People With Disabilities

Update on the Treatment of Childhood Movement Disorders

by Anne Kirkland

The variety and complexity of childhood movement disorders have made accurate diagnosis and effective treatment a difficult task for pediatricians and even specialists. Fortunately, in the past few years, research in the field has given rise to new treatment therapies available for specific conditions. These therapies have often improved considerably the quality of life for children affected with movement disorders.

Since differences between spasticity and other movement disorders are sometimes subtle, making a correct diagnosis can be difficult—particularly for nonspecialists. Even specialists find it beneficial to compare notes with colleagues. A multidisciplinary team—a neurologist, pediatric neurosurgeon, pediatric physiatrist, orthopedist, physical therapist, occupational therapist and a social worker—comes together in a single clinic to examine the child in turn and arrive at a group diagnosis.

For individual patients and their families, the advantages of such a team approach are tremendous. Instead of going from doctor to doctor, in a process that can involve months, if not years, and multiple misdiagnoses, the doctors all come to the patient. Within a few hours, the entire team has met with the child, deliberated and jointly recommended a diagnosis and treatment plan. Beyond the obvious convenience and cost benefit of this approach is the added value of a diagnosis more likely to be accurate. In an area where distinctions between one disorder and another are difficult to pinpoint, or where combinations of disorders may be present, the team approach promises a more comprehensive process.

Chief of pediatric neurosurgery at Children's Hospital of Pittsburgh and professor of neurosurgery at the University of Pittsburgh, Dr. A. Leland Albright directs the Spasticity and Movement Disorders Center at Children's Hospital. "[Movement disorders] are frequently misdiagnosed because there is not enough awareness of the differences in the disorders," says Dr. Albright. "Some people have mixed movement disorders. They'll have a combination of spasticity and dystonia, or chorea and athetosis. And unless one is aware of the different movement disorders and sees a broad spectrum of kids who have CP, one often thinks that every child with CP has spasticity."

The Spectrum of Pediatric Movement Disorders

Perhaps one reason why other movement disorders are often misdiagnosed as spasticity is because it is by far the most common movement disorder. Approximately 65 percent of people with cerebral palsy (CP) and many people who sustain traumatic brain injuries each year develop spasticity.

Spasticity, a condition that causes stiff, tight muscles, especially in arms and legs, may make movements jerky or uncontrollable and interfere with gait, movement and speech. Spasticity is usually caused by damage to the area of the brain or spinal cord that controls voluntary movement. In a person suffering from spasticity, the brain sends fewer messages to the muscles to tell them to relax. The disorder can also occur in people who have suffered a stroke, have multiple sclerosis, spinal cord injury or certain metabolic diseases.

The degree of spasticity varies from slight muscle stiffness to severe, painful and uncontrollable muscle spasms that may be triggered by a simple movement of the arm or leg, or something as minor as skin irritation or a full bladder. Other symptoms include exaggerated deep tendon reflexes (a reflex within the body), scissoring (involuntary crossing of the legs) and fixed joints. Spasticity can be painful, especially if it pulls joints into abnormal positions called contractures. Contractures develop when a muscle is not regularly stretched or put through its full range of motion. Muscle tendons shorten, making subsequent stretching of the muscle more difficult and leading to further decreases in range of motion. The affected muscle may develop fibrous scar tissue, limiting its range of motion even further. If untreated, contracture can lead to permanent and often painful abnormal postures.

Dystonia is a neurological movement disorder characterized by sustained muscle contractions that result in twisting and repetitive movements or abnormal postures. According to the Dystonia Medical Research Foundation, it is the third most common movement disorder after Parkinson's disease and tremor, affecting more than 300,000 people in North America. Dystonia also affects 25 to 35 percent of people with CP. Dystonia can affect any part of the body, including the arms, legs, trunk, neck, eyelids, face or vocal cords. Though the exact cause of dystonia remains unknown, researchers believe it is due to abnormal functioning of basal ganglia, which are deep brain structures involved in the control of movement. Dystonia can be inherited, but certain forms can be attributed to outside factors, such as CP, exposure to certain medications, trauma, toxins, infections or stroke.

Since there is no laboratory test to confirm a diagnosis of dystonia, it is crucial for the individual who has dystonia to be evaluated by a doctor who is familiar with and able to recognize the characteristic movement. Correct diagnosis depends on a physical and neurological examination and on information taken from the patient.

Athetosis and **chorea** each occur in approximately 5 to 15 percent of people with CP. Athetosis is characterized by slow writhing motions of the arms and hands. Chorea is characterized by brief, rapid, jerking movements that may involve the whole body and have been described as "dancelike."

Ataxia is a movement disorder that affects an estimated 150,000 people in the United States. Hereditary and sporadic ataxias are a group of neurological disorders characterized by a lack of coordination while performing voluntary movements. The movements of people with ataxia may appear disjointed, jerky, clumsy, inaccurate or unstable. Hereditary ataxia affects the cerebellum and spinal cord and is passed from one generation to the next through a defective gene. Some five percent of people with CP have ataxia.

Sporadic ataxias are also common, occurring spontaneously in individuals with no known family history of ataxia. In these cases, ataxia may be due to environmental toxins or medical conditions such as tumor or stroke. The earliest symptoms of ataxia are unsteadiness or clumsiness. Because ataxia destroys both nerve and muscle cells, the disease is progressive and eventually affects an individual's ability to walk. Vision and speech, and in some cases hearing, may also be affected.

Tremor occurs in Parkinson's disease, dystonia, multiple sclerosis and CP. According to the National Institute of Neurological Disorders and Stroke, tremor is defined as a rhythmic, shaking movement of a part of the body caused by muscle contraction. Tremor is the most common of all involuntary movements, variously affecting the head, face, vocal cords, trunk, legs and especially the hands.

Treatment Options

A wide range of treatments is available for patients with movement disorders, including oral medications, intramuscular injections, surgical procedures and physical and occupational therapy.

At Dr. Albright's Spasticity and Movement Disorders Center, the team's evaluation of the patient is critical to the process of arriving at the right treatment plan. Treatments vary according to the patient's age, physical condition and the nature of the movement disorder, and may include one or a combination of treatment options.

Oral and Injected Medications

Oral Medications: The four oral medications most commonly prescribed to treat spasticity are baclofen, dantrolene, tizanidine and diazepam. Most of these medications have been used for the past 20 years and are, in general, mildly effective. However, moderate or severe spasticity is almost never completely eliminated by oral medications. Movement disorders other than spasticity are often treated with different oral medications such as clonidine, trihexyphenidyl or carbidopa-levodopa. For about one third of children who have athetosis and chorea, oral medications such as baclofen, clonazepam, diazepam and propanolol are helpful.

The Dystonia Medical Research Foundation gives a comprehensive list of oral medications available for people who have dystonia. These include drugs that impede nerve impulses (called anticholinergic drugs) such as trihexyphenidyl, benztropine or ethopropazine, which work by blocking the action of acetylcholine, a neurotransmitter that activates muscle contractions. Dosage is usually governed by the severity of the side effects, which may include confusion, drowsiness, hallucination, personality change and memory difficulties. Benzodiazepine drugs such as diazepam, clonazepam and

continued on page 46

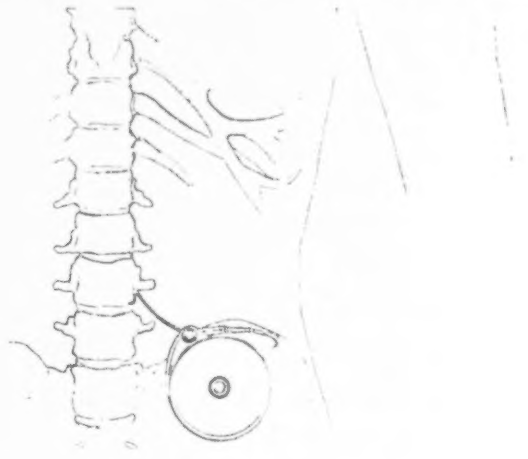
continued from page 45

lorazepam are also used to treat dystonia. The primary side effect is sedation, but others include depression, personality change, and drug addiction. Some dystonia patients may tolerate very high doses without apparent adverse effects.

Intramuscular injections are a treatment option for children who have focal spasticity or dystonia. Intramuscular injections are given to patients to decrease spasticity in specific muscles. The advantage of this form of treatment is its localized effects. The medications weaken only the injected muscle and rarely cause any kind of central nervous system side effects. Botulinum toxin has become available in the past decade and is now frequently used for this purpose. Seven subtypes of botulinum toxin have been isolated, each with different properties and actions. Of these subtypes, botulinum toxin type A, available as Botox, is currently the most studied and most widely used. Botulinum toxin type B is approved by the U.S. Food and Drug Administration (FDA) for treatment of cervical dystonia (spasmodic torticollis).

The dose of botulinum toxin varies according to the size of the muscle injected and the severity of the spasticity. Improvement usually begins within two to three days after the injections and lasts from two to four months. During this period of decreased spasticity in the treated muscle, physical therapists often perform serial casting and begin therapy to increase range of motion. It is important to note that injections of botulinum toxin should only be performed by a physician who is trained to administer this treatment and is familiar with the involuntary movements of the person being treated.

Injections may be repeated several times, although its effectiveness seems to decrease after multiple injections. It has been reported that in some instances a person may form antibodies in response to the complex proteins in botulinum toxin, making subsequent treatments ineffective. One way to minimize the chance that the patient will build up immunity to botulinum toxin is to limit exposure by having treatments no more frequently than every three months.



The Intrathecal Baclofen Therapy is delivered via a surgically placed pump.

When to Consider Surgery

Spasticity-reducing surgery is typically performed for one of three reasons: to improve function, to facilitate ease of care and to reduce the risk of contractures. If improved function is the goal, the team evaluates the child for muscle tone, trunk strength, underlying muscle strength, motivation and ability to comply with therapy. Functional improvements often include improved communication, swallowing, activities of daily living and mobility. Surgery will also be considered if the outcome will facilitate care and help make the activities of daily living easier for the caregiver. In these cases, the team looks at how difficult it is to dress, toilet, feed, position and transfer the child for whom surgery is being considered.

At the same time, it is important to know that surgical treatment is not recommended for everyone. Some patients are too young or too small to be appropriate candidates for surgery, while others are effectively treated by oral medications or alternative therapy. When appropriate, a patient can be reevaluated after a specified period of time.

Surgical Options

Orthopedic surgery can correct or prevent the muscle and bone deformities that are caused by spasticity, but it does not directly change the spasticity itself.

Surgery is recommended for children at least 5 years old, but the best outcomes for surgery result when a child has developed a stable gait pattern, which many consider to occur after 7 years of age. By this age, a child with spasticity has probably undergone other treatments. Surgery is often utilized if these prior treatments no longer seem effective.

The most common orthopedic surgeries are tendon lengthening or release, tendon transfer and osteotomy.

Tendon lengthening or release is a procedure in which the tendon part of a particular muscle is divided into

continued on page 48

Glossary of Movement Disorder Terms

Ataxia: a group of neurological disorders characterized by a lack of coordination while performing voluntary movements.

Athetosis: a movement disorder characterized by slow writhing motions of the arms and hands.

Baclofen: An antispasmodic drug administered orally or by means of a surgically placed pump to reduce spasticity throughout the body.

Botulinum toxin: Any of several nerve toxins derived from the bacterium Clostridium botulinum, which are injected into muscles to permanently reduce spasticity.

Botox: The commercial name for a medication made from botulinum toxin A.

Chorea: A movement disorder characterized by jerky, arrhythmic, "dancelike" movements that may involve the whole body.

Contracture: Abnormal, painful joint positions caused by spasticity in the surrounding muscles.

Deep brain stimulation: An experimental treatment for CP-related tremors and dystonia in which an electrode is implanted in a specific area of the brain that adjusts movement.

Diplegia: Excessive stiffness usually in all limbs, but greater stiffness in the legs than in the arms.

Dystonia: A neurological movement disorder characterized by sustained muscle contractions that result in twisting and repetitive movements or abnormal postures.

Focal spasticity: Spasticity localized in one area of the body.

Generalized spasticity: Increased tone or contraction of muscles, causing stiff and awkward movements.

Hemiplegia: Paralysis of one side of the body.

Intramuscular: Within the muscle.

Intrathecal baclofen: Baclofen that is administered directly to the spinal fluid by means of a surgically placed pump.

Intrathecal Baclofen Therapy (ITB Therapy): delivers Lioresal Intrathecal (baclofen injection), an antispasmodic drug, directly to the fluid surrounding the spinal cord in small, precisely controlled doses using a pump that is placed internally.

Neurologist: A doctor who specializes in the nonsurgical diagnosis and treatment of disorders of the nervous system.

Neurosurgeon: A physician specializing in surgery of the nervous system.

Occupational therapy: Therapeutic use of work, self-care and play activities to increase independent function and enhance development. It may include adaptation of task or environment to achieve maximum independence and enhance quality of life.

Orthopedic surgeon: A physician who specializes in the diagnosis and treatment of injuries and diseases of the musculoskeletal system.

Physiatrist: A doctor who specializes in physical medicine or physical therapy.

Physical therapy: The appropriate use of therapeutic exercise, rehabilitative programs, and physical agents—such as massage, heat, hydrotherapy, radiation and electricity—under the direction of a licensed physical therapist.

Selective dorsal rhizotomy (rye-ZOT-o-me): A surgical procedure in which nerve roots are exposed and tested for function and nonfunctioning nerves are cut to permanently reduce spasticity in selected muscles.

Serial casting: A treatment option using a series of casts to increase range of motion. The casts are replaced weekly or biweekly to progressively stretch the muscles in small increments.

Spasticity: A movement disorder characterized by abnormally high muscle tone, causing stiffness or tightness of the muscles that may interfere with gait, movement and speech.

Spastic quadriplegia: Spasticity that affects both the arms and legs.

Tremor: A rhythmic, involuntary muscular contraction characterized by oscillations (to-and-fro movements) of a part of the body.

continued from page 46

halves and then the ends rejoined to create one longer tendon. This allows greater movement of the joint and less tension on the muscle.

A **tendon transfer** involves detaching a tendon from its original position and attaching it to another site. After surgery, a cast or brace is then put in place for three weeks.

Because bone deformities often occur as a result of muscle tightness, surgery to reposition the bone may become necessary. **Osteotomy** is a procedure that is performed on the thigh bone (femur) to correct alignment with the hip socket. The ball at the top of the thigh bone is cut and repositioned into the hip socket. Sometimes surgery is required on the socket to make it deeper and provide better support for the top of the femur. After surgery, a cast is sometimes necessary but not in all cases.

The long-term results of orthopedic surgery are considered to be better in adults with cerebral palsy than in children with the disorder. These orthopedic procedures are all performed when the patient is under general

Nick and ITB Therapy

From the time 11-year-old Nick Cugini was diagnosed, at 6 months old, with a developmental disorder that was later confirmed as cerebral palsy, his parents, Rob and Eve, had actively researched treatment options. "Nick was seen by a neurologist, an orthopedic surgeon and a physical medicine and rehabilitation specialist, and began a physical therapy regimen. We tried a number of things outside of traditional therapy," Eve recalls. "We were really willing to try things that were not too invasive. Botox was about as invasive as it got. We just couldn't keep up with the spasticity."

Nick, who has spastic quadriplegia, wanted to be able to walk. Instead, in the months leading up to the family' s decision to try surgery, he began to experience a lot of pain and his physical condition regressed. Eve Cugini says, "He was beginning to get into a crouch position, not able to move, and we were up every night with muscle cramps and charley horses." Up until then, Nick had been mobile with a walker, but Eve and Rob worried that he would soon have to go back to using a wheelchair.

Nick' s physical therapist and his physical medicine and rehabilitation specialist, with whom the Cuginis worked most closely, recommended that they consider the intrathecal baclofen pump for Nick—a treatment option the Cuginis knew very little about. Nick' s pediatrician had diagnosed his developmental disorder, but was not knowledgeable enough about CP to recommend treatments. Says Eve, "If his physical therapist hadn't pushed, we probably wouldn't have known (the ITB pump) was out there."

When Nick was 8, he and his parents made a decision that has had a significant impact on the quality of Nick' s life. In June 1999, Nick underwent surgery to receive the Intrathecal Baclofen Therapy (ITB™ Therapy) pump to treat the spasticity caused by his cerebral palsy.

At first, Eve wondered if the ITB pump was the right treatment for Nick. "I knew a couple of children who had been through the process, but they were much more (physically) involved than Nick is. I really needed to see other children who are ambulatory who have been through this process."

The Cuginis weighed the dangers of surgery against the amount of pain Nick was experiencing and his deteriorating quality of life. "The thought of surgery is very frightening," Eve confesses, "but I had a lot of trust in these people who were an integral part of our lives. We started researching the pump and, of course, immediately found out about Dr. Albright." She placed a call to Dr. Albright' s office in Pittsburgh. "They were very generous with us, and even hooked us up with a young adult who had had the pump whom Nick and I could talk to about the difference it had made in his life." Soon afterwards, the family flew to Pittsburgh so that Dr. Albright and his team of specialists at the Children's Hospital could evaluate Nick. According to Dr. Albright, at age 8 Nick was an appropriate candidate for the ITB pump because of spasticity in both his arms and legs.

Nick and brother Alex (l.).

The Cuginis made plans to go ahead with the implant. Eve points out that it is important to schedule surgery in the summer so that the child will have enough time to recover from the surgery and work on building back strength before returning to school. "Nick had the ITB pump implanted in June, spent five days in the hospital, another couple of weeks doing very little, and then began physical therapy with his private therapist."

The difference in Nick' s physical condition was apparent as soon as he woke up from the surgery. "In the hospital anestesia and require a hospital stay of up to five days. Orthopedic techniques can be used in combination with other treatments, such as the selective dorsal rhizotomy, ITB therapy or Botox treatments.

Intrathecal Baclofen Therapy (ITB Therapy): ITB Therapy delivers Lioresal Intrathecal (baclofen injection), an antispasmodic drug, directly to the fluid surrounding the spinal cord in small, precisely controlled doses using a pump that is placed internally. Research by Dr. Albright has demonstrated that ITB Therapy is effective in more than 86 percent of people with severe spasticity, including many who have not had good results with oral medications.

To determine if a patient is a candidate for the baclofen pump, the individual must receive a test dose of the drug so that physicians can study its effects. Once it has been determined by the baclofen trial that there is a successful reduction in muscle tone or dystonia, the patient can have the pump placed. In a procedure that lasts about an hour, the pump is placed in the

continued on page 50

Nick rounding the bases

he was able to lift his arms over his head for the first time in his life," Eve recalls. Now, three years later, Eve reports the results are still positive. "There' s been a significant change in the level of function and the pain. We are never up in the middle of the night with any sort of muscle cramps. He walks with his walker at school and wherever we go, he' s ambulatory."

To maintain the therapy, Nick's physical medicine and rehabilitation specialist in Houston refills the pump every three months, and once a year the family travels to Pittsburgh to meet with Dr. Albright and have Nick checked out. "Fortunately, Nick is on a low dose of baclofen, and there is plenty of room for any dosage increases that may be necessary in the years ahead." Since the pump's battery life is approximately six to seven years, Nick will undergo another surgery to replace the pump when he is about 15. "We are already planning to go forward with that surgery. We have weighed the different aspects and have decided we want to continue using the pump. Nick was really the one who made the decision—from the start, he has always been part of the decision-making process."

Both mother and son are doing all they can to share Nick's success story with others. Since his surgery, Nick has had the opportunity to talk to two other little boys before they had the ITB pump implanted. "He's been able to talk to them and say, 'Don' t be afraid. The doctors are nice, the nurses are nice, you' re going to feel so much better,'" Eve reports proudly.

Eve herself runs a nonprofit organization, the Family to Family Network, which she started because "there's so much information out there and getting information from another family is such a good way to find out about it." The organization serves as a support network for parents in the Houston area who have children with disabilities, and also trains parents to be more effective advocates for their children at school, in the medical community and in the community at large.

Reflecting on the family's experience with ITB therapy, Eve says: "We feel a huge debt of gratitude to Dr. Albright. He has significantly changed the quality of my child' s life. I really want people to know that I understand how frightening the prospect of surgery can be. I also know the difference it has made in my child' s life. It was a summer, and not a huge time commitment. He's out there, he's playing baseball and karate, he' s about to earn his sixth belt in karate, he' s doing so many things that he may not have been able to do had he not had this opportunity."

To learn more about ITB therapy or to locate a center that provides treatment for spasticity, visit www.spasticity.com.

For more information on Family to Family Network contact them at: (713) 466-6304 or via the Web site: www.familytofamilynetwork.org

continued from page 49

abdomen while the patient is under general anesthesia. A catheter runs under the skin from the pump to the back and is inserted into the spinal fluid. The pump is then programmed by an external computer to release continuously a specified dose of baclofen, as determined by the physician. The pump, approximately the size of a hockey puck, comes in two sizes, and needs to be refilled every two to five months, depending on the pump size, concentration and dose. Refills are done using a syringe and needle and take approximately 15 to 20 minutes to complete. The battery in the pump lasts four to seven years, at which time the patient will need to undergo another surgical procedure to replace the pump. The therapy is also reversible.

For patients with functional goals, ITB Therapy reduces spasticity to allow physical therapists to engage them in strengthening programs. Possible risks in use of ITB therapy are mechanical complications with the pump and/or catheter, and chance of infection at the wound site. Adverse effects from the baclofen are usually temporary and may be managed by adjusting the dosage from the pump. Among the most common are headache, low muscle tone, drowsiness, nausea and dizziness.

Selective dorsal rhizotomy is a surgical procedure that helps permanently

reduce spasticity primarily affecting the legs. During a rhizotomy, the nerve roots in the back are exposed. Each nerve root is tested with special monitoring equipment to accurately detect which ones are not functioning properly. These nerve roots are cut. Rhizotomy surgery generally lasts about two to three hours. Surgery is followed by physical therapy to increase leg strength and improve gait. The primary goal of rhizotomy surgery is often to improve walking; however, the procedure can be done at any age to facilitate care. Its most significant drawback is that its effects are irreversible. It is important to note that a rhizotomy will relieve spasticity but not improve contractures that are already present, nor is it an effective treatment for dystonia, athetosis or chorea. Rhizotomies are recommended for 5 to 10 percent of new patients with spasticity in the arms and legs, and in a higher percentage of those with spastic diplegia.

Deep brain stimulation is an investigational treatment for dystonia approved by the FDA for use with children and young adults (aged 12 to 21) who have failed oral medications and, in most cases, have not responded to ITB therapy. A tiny electrode is inserted into the internal globus pallidus, a small structure deep in the brain that is involved in the control of movement. The electrode is connected by a wire

SPASTICITY TREATMENT OUTLOOK

METHOD	AGE (YEARS)	APPROPRIATE CANDIDATE	OUTCOME
Oral Medications	Any age; most often 2-5 years	Spastic quadriplegia; Diffuse spasticity	Mild decrease in spasticity in arms and legs Often need SDR or ITB later
Botulinum toxin Injections	Any age; less often over 10	Spastic diplegia; spastic quadriplegia Isolated spasticity Too young for selective dorsal rhizotomy or ITB	Decrease in spasticity injected muscle(s) for 2-4 months Improved walking; sometimes improved arm function
Rhizotomy (SDR)	4 to 8 (most common)	Spastic diplegia or quadriplegia capable of activities of daily living (ADLs) Good leg strength; no severe contractures; motivation for physical therapy Severe leg spasticity; interferes with care	Marked, permanent, non-adjustable decrease in spasticity Improved gait; improved ADLs
Baclofen (ITB)	Enough body mass to support the pump	Spastic quadriplegia; spasticity in legs greater than or equal to spasticity in arms; capable of ADLs Spasticity nterferes with comfort, care ADLS & function	Decrease in spasticity Improved walking; improved ADLs; improved speech; decrease in orthopedic operations; easier care; reversible
OT/PT	Any age	Spasticity of any extremity Spasticity impairs function or reduces range of motion	Increased range of motion, strength, function Improved function or ease of care, minimize deformity
Orthopedic Surgery	Any age, most common over 4 years	Hip dislocations Muscle/tendon contractures Bone/joint deformities	Increased range of motion; improved gait; decreased deformity Depends on goals

under the skin to a thin electrical stimulator implanted just below the collarbone or in the abdomen. The stimulator is programmed by computer to activate the tip of the electrode to provide quick pulses of electricity to interrupt the abnormal electrical brain circuit that seems to be causing the dystonia. The four-hour surgical procedure to implant the electrode is performed under general anesthesia and the child spends two days in the hospital post-surgery. Currently, Dr. Albright's Spasticity and Movement Disorders Center is the only clinic in the country approved by the FDA to perform this investigational treatment in children. In addition to

FOLLOW-UP CARE	SIDE EFFECTS; RISK	COST ESTIMATES
PT, OT as needed	Drowsiness	Medications= $40 - $60 (each month)
PT, OT to increase range of motion and to increase strength	None with usual doses	Procedure: injection(s)= $250-$400 Medication each time, cost depends on dosage= $400 - $800 (every 3-4 months)
Extensive PT, OT decrease in orthopedic operations	Infection: 2% Wound: 1% Spinal fluid leak: 3%	Hospitalization and surgical procedures= $20,000-$25,000 Intensive PT during first year= $10,000 - $25,000
Frequency of PT, OT depends on goals	Infection: 5-10% Wound: 5-10% Spinal fluid leaks: 5-10%	Hospitalization,implant procedure, pump = $25,000 - $30,000 Initial medication = $400 Medication refills (3-5/year)=$200 - $300 Pump replacement: repeat hospitalization and procedure every 4-7 years
Depends on goals, motivation	None	$100-150 per treatment session
PT, depending on goals	Infection 25% Bony non-unions 25%	$20,000 or more

studying its uses for dystonia, the team has used deep brain stimulation to successfully treat tremors related to CP.

Other Therapies

Physical and Occupational Therapy: Gentle stretching and range-of-motion exercises, as prescribed by a physical therapist, are important adjunct therapies for people with CP and those with dystonia. Stretching and strengthening exercises are especially important in preventing or limiting the permanent muscle shortening caused by contractures. Contractures may also be treated with serial casting to allow tendons to stretch.

The metabolic disorders that cause

Brigid's rhizotomy

by Kathleen Mason

My husband Greg and I are the parents of Brigid, who is 16 and has cerebral palsy. She uses a power wheelchair for mobility. Since she was diagnosed with CP at the age of 6 months, she has been receiving physical, occupational and speech therapies. Brigid had a rhizotomy when she was 2 years old.

Brigid Mason above and at left on stage performing with the band.

Before the rhizotomy, spasticity would cause her to sit in the "W" position and made her legs scissor (involuntary crossing of the legs in front as a result of muscle contractures). Spasticity also affected how she ate—she could not eat solids. Brigid was enrolled in an early intervention program where therapists did the usual stretching and strengthening exercises. They were not effective. I remember sitting in on those sessions and saw the physical therapist becoming increasingly concerned about how tight Brigid felt.

They suggested we see a pediatric orthopedic surgeon. The surgeon informed us that a rhizotomy would let Brigid be more comfortable and not as tight as she was before. He felt she was the right candidate and at an age when she won't remember everything—and she doesn't. After his recommendations, he referred Brigid to a pediatric neurosurgeon who performed the rhizotomy. Surgery was followed by six weeks of intensive therapies at a rehabilitation facility.

This surgery and its rehabilitation were not easy, but did give us hope, and ultimately improvement. I had feelings of fear, nervousness and worry. It was two weeks after surgery when I realized we had made the right decision. Brigid had some tightness in her throat due to CP which made it hard for her to eat; she had only been able to eat pureed food. During rehabilitation, Brigid began to eat cheeseburgers and drink chocolate milk. We were encouraged that the surgery had worked.

The rhizotomy alone does not give immediate results; for Brigid, it was the combination of therapy and three other surgeries along with follow-up of intensive therapy. She was still tight in her hips and legs which affected her range of motion and ability to function. Brigid had hamstring/heel cord lengthening at age 3 and hip abductor lengthening when she was 5, followed by home recovery and then a seven-week stay at the rehabilitation facility. Her last surgery, when she was in fourth grade, was to put metal plates in her hips and rotate her femurs. This was followed by intensive at-home therapy by her physical therapist. I stand by our decision to do what we did and when. There was a lot of thought, time and energy that went into the decision.

We were told these efforts would help Brigid live a more comfortable, active and enjoyable life. Now Brigid is 16 years old; I look back and think the doctor was right and am glad of what we did when she was 2. She is not as tight, and that makes her range of motion more effective in daily living skills.

At this point no further surgeries are recommended. Currently, Brigid continues physical, occupational and speech therapies to manage spasticity, receiving therapy services at DuPage Easter Seals in Villa Park, Illinois.

Recently, we had Brigid evaluated by a physical therapist who specializes in therapeutic ways for Brigid to manage her difficulties in breath support to aid in speaking and eating. She also suggested a few exercises for the speech therapist to use during treatment. All her therapists have done an outstanding job! Brigid is getting stronger, speaking more clearly, and growing in her self-confidence.

Living here in Naperville, Illinois, has been great for all three of us. People are getting to know Brigid, not for her disability, but for the good person she is and accept her for that. Brigid is now in her sophomore year at Neuqua Valley High School in Naperville, Illinois. There she is involved in the marching band. She will be confirmed on April 20, 2002, at Holy Spirit Catholic Community Church. Brigid enjoys participating in power wheelchair soccer, bocce ball, recreational sports and Saturday night activities through Western DuPage Special Recreation Association, located in Wheaton, Illinois. Brigid is a hard-working, social, warm-hearted typical teenage person. She has had her difficulties coping with her disability but she has overcome them, which truly makes her an inspiration.

continued from page 53

ataxia may be treated with controlled diets and special medications. If the ataxia is due to a toxin, avoiding the toxin and taking particular anti-toxin measures may be appropriate. Most other causes of ataxia, including hereditary forms of ataxia, do not have specific treatments, and there is no replacement for cerebellar cells that die or which never developed properly. The most effective treatment often consists of physical therapy to train and strengthen muscles to compensate for lost function in other muscles. Gait and balance training may also be helpful.

While no single treatment is universal, the range of available treatment options and the potential for combining treatment therapies mean that children with movement disorders now have more choices. They also have a greater possibility of seeing measurable and—in some cases—remarkable improvement in their condition. For more information on individual movement disorders and on different treatment options, consult the resources included here. Also, consider visiting a facility with a movement disorder clinic where a multidisciplinary team is available to make an accurate diagnosis distinguishing between similar conditions and to recommend the optimal therapy treatment. ■

Putting theory into practice

A. Leland Albright, MD, a nationally renowned expert in the treatment of neurological disorders in children, has performed spasticity reduction procedures since 1985 and has led pioneering research in new treatments for movement disorders. He was the first investigator in the United States to be approved by the FDA to study the use of intrathecal baclofen. Dr. Albright was also the first to perform deep brain stimulation on tremor resulting from cerebral palsy.

The chief of pediatric neurosurgery at Children's Hospital of Pittsburgh and a professor of neurosurgery at the University of Pittsburgh, Dr. Albright directs the Spasticity and Movement Disorders Center at Children's Hospital, a facility that draws referrals from all over the country. The clinic, which currently follows 1,500 patients and evaluates 150 new patients each year, takes a team approach to evaluating and treating children and young adults with spasticity and other movement disorders such as dystonia, chorea, athetosis and tremor.

Dr. Albright describes the team approach used at the center. "There's a multidisciplinary clinic here at the Children's Hospital every Wednesday morning. Children are seen by six different specialists, and after all of us have seen a child, we discuss what we've found and what we think, and put our heads together and come up with what seems in the group's opinion to be the best recommendation."

"We use a lot of oral medicines and Botox, but those are mostly in kids who are 2 to 6 years old," Dr. Albright says. "We recommend rhizotomies for children who are usually 5 to 8 years old, who have good strength in their legs and are ambulatory and are less affected from the waist up. And then we use the baclofen pump for kids who have a lot of spasticity in both the arms and legs and also for those kids who have severe dystonia. For a few others, we recommend deep brain stimulation."

Treatment centers of the future

Dr. Albright's commitment to the study and treatment of movement disorders spans his 25-year career in pediatric neurosurgery. Looking forward, his dream and long-range goal is to have a national center for cerebral palsy treatment and research. "One might think that to have a CP center, just get a bunch of equipment. That is not the case. What we need are people who are committed to doing research, to studying the different kinds of CP, to studying the different treatments." Dr. Albright points out that though two to three children out of every 1,000 born have CP, "very little research is being done in CP."

While centers of excellence exist for pediatric orthopedic surgery in CP, currently no center in the US focuses exclusively on new and experimental treatments for CP. Dr. Albright envisions a comprehensive site providing "state-of-the-art care and evaluation" to treat the spectrum of problems "regardless of whether they are orthopedic, neurological or surgical in nature." Dr. Albright notes, "You can make so many children with CP more comfortable, improve their function or decrease their complications from CP. You can really make some amazing changes in their lives."

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

Positive Behavioral Supports (PBS) for Young Adults:

MEETING BEHAVIORAL CHALLENGES IN COMMUNITY-BASED SETTINGS

By Julie Fodor, PhD, Kimberly Brown Campbell, MA and Celia Flinn, MEd

Greg Larson, a Behavior Consultant at CDHD, helps Dan Skelton complete his Positive Behavioral Supports self-management worksheets.

In greater numbers than ever before, young adults with developmental disabilities and challenging behaviors are graduating from high school alongside their peers. Most would agree that the similarities are remarkable—a new generation of self-confident and accomplished youths with the same hopes and dreams for leading successful independent lives.

Oftentimes, however, this passage into adulthood is overshadowed by uncertainties and worries. Parents of children with behavioral challenges ask: What resources and supports are available in the community? Have all the years of special education adequately prepared my child for successful life experiences in community-based settings? Who will take the role of advocate now to insure that my child's special needs are met?

With the advent and implementation of Positive Behavioral Supports (PBS) in community-based settings in our area, the majority of young adults with whom we work have proven to be capable of experiencing fulfilling lives after high school and becoming active, functional members of society. In addition to maintaining semi-independent- or independent-living situations, these young adults are productively engaged in supported employment, and participate in age-appropriate classes with their peers at day

This article is dedicated in memory of Jean E. Overholt-Emery, MEd, for her many years of service and devotion to the fields of special education and service coordination for individuals with developmental disabilities.

586

treatment centers. They participate in Special Olympics and numerous other community groups.

While many have heard the term Positive Behavioral Supports and are aware that these principles are used increasingly with children who experience challenging behaviors, the concept is relatively new in adult populations within community-based settings. Over the last seven years, our Behavior Consultation Department has experienced a high degree of success using PBS strategies to assist young adults in northern Idaho.

Laura Hart, who will be graduating from high school this year, works on a feeling identification exercise with Greg Larson, a CDHD Behavior Consultant.

The University of Idaho's Center on Disabilities and Human Development (CDHD) in Moscow, ID, provides Behavior Consultation as just one option created for individuals in the state who qualify for Medicaid-funded waiver services. The waiver is designed for adults with developmental disabilities who are working toward independent living within the community. Four Behavior Consultants at the CDHD implement the PBS program that serves two counties.

What are Positive Behavioral Supports?

Positive Behavioral Supports are common-sense approaches to developing person-centered behavioral interventions. They are team-oriented and offer a simplified format for preventing challenging behavior by teaching self-management skills and replacement skills. As a result, they serve as prevention against problem behaviors that might escalate into crisis situations. Ultimately, Positive Behavioral Supports are implemented through the dynamics of team collaboration, individualized therapy and consistent follow-through in community-based settings.

Self-management skills permit young adults to communicate their needs in an appropriate and socially acceptable manner. For example, modeling the behavior of a peer or caregiver teaches an individual how to order dinner at a restaurant; the goal is for the individual to self-manage this behavior and eventually generalize its use in other restaurants in the future.

Young adults respond best to their own specific learning styles; instructors and peers in school and other community-based settings may have already identified them.

How Does PBS Work?

The Center on Disabilities and Human Development Behavior Consultation Department has devised a protocol for use of PBS with people who are transitioning into independent or semi-independent community living situations. Upon an individual's referral to the program, the Behavior Consultant (BC) obtains releases of information, and reviews the individual's personal files and historical data. Then the BC arranges a meeting with the individual's parents or guardians to gather more information and to determine strengths, needs and interests.

Over a period of several weeks before graduation, the individual is observed in school to determine strengths and needs for the future. The BC then interviews parents and teachers to collect more information about

continued on page 60

continued from page 59

the individual's learning styles and previous learning experiences, in order to incorporate existing skills into the new behavior plan.

Young adults respond best to their own specific learning styles, which instructors and peers in school and other community-based settings may have already identified. If a style is not yet established, a variety of techniques can be used to determine which works best, including visual, verbal and/or tactile modes of instruction. We recommend encouraging self-instructional methods whenever possible. Often, self-instruction and self-monitoring receive a warmer reception and foster increased self-esteem and independence. An example of a positive self-instructional method is to have young adults create their own checklists for completing tasks. They can then self-monitor their progress over time with repeated use of the checklist.

Simple strategies are employed to set the person up for success and to encourage positive, self-directed choices that become new habits.

After completing the initial interviews, the BC and parents or guardians form a team and devise a behavior plan that is best suited for the individual's transition from high school to the working world. Jana Schultz, a parent whose son received Behavior Consultation for two years, described the initial transition from high school to the adult world as very difficult. Jana and her son, Toby, wanted the transition process to be a team effort from the beginning. At first, she said, there were few support systems in place and the family felt it was difficult to access services without outside assistance. "There is no way as a parent that you can easily learn what services are out there and access them alone," states Schultz. She believes that families need professionals to help them access resources within the community. Fortunately, with the assistance of his high school special education teacher and his service coordinator, Toby was eventually connected with developmental disability services and the PBS program at the University of Idaho.

Sariah Mackowiak, a program coordinator for a local residential habilitation agency, works with four people who receive Behavior Consultation. She thinks that the biggest advantage of PBS is its ability to teach young adults with behavioral challenges how to self-manage negative behaviors. "It allows young adults to gain independence and promotes more positive social relationships with their peers. These factors help eliminate crisis situations and increase self-confidence, thus naturally reducing behavioral issues," says Mackowiak. PBS helps parents understand how to address behavioral issues they might have struggled with for years. "Behavior Consultation gives new perspectives on how to handle behavioral concerns in the home or out in the community," states Mackowiak.

PBS and Self-Management

PBS supports people with DD in self-managing their behaviors and strives to reduce societal barriers to attaining independence and happiness. While many settings for young adults with challenging behaviors are inclusive or community-based, certain obstacles and stereotypes still undermine the rights and dignity of these individuals. The long-standing "medical model" generally sees the person as the "problem." This approach focuses on "fixing" the individual with a program of consequences and punishment. The medical model in this context is both outdated and potentially harmful.

To fulfill the special needs and desires of individuals with disabilities who experience challenging behavior, it is often necessary to change the environment in which the individual lives and works. "In my experience working with high school students," explains Jerry Hartstein, special education teacher at Moscow (ID) high school, "consistent follow-through of PBS guidelines has had a major positive effect on a student's ability to hold a job and be successful in community-based workplaces."

Hartstein says team collaboration with PBS personnel insures that consistency is maintained in school, home and work environments. When teachers, staff, job coaches and therapists are clear on behavior goals and objectives, students are able to understand and meet expectations. "Ultimately, students reap the rewards. They are happier and can participate more fully in all aspects of their lives in the community," he explained. When discussing students who have benefited from PBS, Hartstein identified Shahna Sprecher, who graduated eight years ago and has been receiving Behavior Consultation for the last six years. "She is doing better than ever out of school," he said.

Shahna, who has Down syndrome, experienced a smooth transition from high school to community-based living.

"It was both challenging and exciting for her," said her mother, Leah. "The supports she received with behavioral issues in high school helped her prepare psychologically to go out into the world of work." Today Shahna receives two hours of Behavior Consultation a week, lives at home with her mother, maintains a part-time job, and attends a day treatment center with her peers. According to her mother, Positive Behavior Supports have been a tremendous help.

Shahna has benefited most by responding more positively to new situations as they arise. She makes eye contact now, and asks for what she needs instead of suddenly running away and compromising her safety. According to Shahna's mother, she is learning responsibility and consistency. "She has learned what to do in order to stick with things. Over the years, personality changes and new social skills have helped her to relate better to others," explains Leah Sprecher.

Behavioral Intervention Plans

Behavioral intervention plans, which are created by the Behavior Consultant with input from the team and family, contain concise, measurable goals and objectives. These plans provide guidelines for practical and attainable implementation. The PBS intervention plan calls for individualized behavioral therapy sessions and application of PBS strategies by both the Behavior Consultant and community service providers.

In the therapeutic setting, instructional methods are highly individualized and cover a broad spectrum of topics. Individual behavior consultation sessions of one-on-one time between the young adult and the Behavior Consultant ideally range from two to six hours per week. Subjects include training in social pragmatics, self-management, problem-solving and communicating emotions appropriately. Other self-management techniques are also taught, to help reduce stress and anxiety or to develop and nurture creative expression.

Multifaceted behavior plans are created, emphasizing the return of control and responsibility to the young adult. Simple strategies are employed to set the person up for success and to encourage positive, self-directed choices that become new habits. Ultimately,

Exceptional children deserve exceptional care.

The best help for cerebral palsy, spina bifida and related disorders is at Kennedy Krieger Institute.

For 61 years, Kennedy Krieger Institute has been the leader in helping children with severe disabilities. Focusing on early identification, intervention and treatment, our state-of-the-art interdisciplinary team approach—combined with a caring, supportive touch—has enabled generations of children to live their lives to the fullest.

Our comprehensive assessment and treatment for children with cerebral palsy, spina bifida and related disorders includes: Neurology, Medical Services, Nursing, Urology, Orthopedics, Physical Therapy, Occupational Therapy, Orthotist, Clinical Psychology, Neuro-Psychology, Seating, Feeding, as well as Rhizotomy, Spasticity and Movement Disorder clinics.

And unlike many programs, we see patients beyond age 18. Call Kennedy Krieger Institute today. We're here to help.

continued from page 61

replacement behaviors shape new worlds for young adults with challenging behaviors by infusing them with unprecedented feelings of self-reliance and self-worth.

One young man, who experiences learning disabilities and is currently on probation, says he is much happier since he began receiving Behavior Consultation two years ago. "Positive Behavioral Supports have helped me keep out of trouble. During therapy, I have someone to talk to about my problems and figure out ways to resolve them without getting angry. It keeps me focused on my responsibilities," he said. "The monthly team meetings are really helpful and keep everyone on track."

Problem-solving can occur successfully with adults in a verbal, written or pictorial format that provides a narrative and/or visual documentation of a behavioral episode.

PBS Self-Development Techniques

After years of working with adults with developmental disabilities, we noted an area of training that seemed to be most neglected and least understood, a multifaceted component called self-development. In our practice, we have found that fostering self-development through direct therapeutic techniques has proven to be a valuable key to successful and long-lasting outcomes. We have also noted that incidents of challenging behaviors and the need for crisis intervention decrease dramatically by combining team collaboration and ongoing weekly behavioral therapy.

Self-development serves as an umbrella under which these PBS skill areas of self-management are found: problem solving, expression of feelings and emotions, social pragmatics and self-management of daily living skills. Below we present samples of four of the techniques we have used successfully. Other techniques we have found to be successful for young adults and their families include positive self-talk, stress reduction techniques and creative exploration through the arts.

PROBLEM-SOLVING

A key element in problem-solving is getting the young adult's input in whatever fashion necessary and encouraging his/her proposals for solutions. Problem-solving can occur successfully with adults in a verbal, written or pictorial format that provides a narrative and/or visual documentation of a behavioral episode. If a written review is used, the parent or BC can follow it with a problem-solving discussion if warranted. The discussion should outline techniques for self-management, and offer helpful suggestions for coping with a similar problem in the future. Problem-solving in this manner encourages a repertoire of new skills to resolve internal and external stressors and conflicts appropriately.

PROBLEM-SOLVING: THINGS TO REMEMBER

- Respond quickly if crisis behaviors occur.
- Interview individuals who were present at the occurrence of the challenging behavior.
- Use a communication format that works best for your child and the team (verbal, written, visual).
- Use the creative process to solve problems.
- Involve your son or daughter as much as possible in the problem-solving process.

FEELINGS AND EMOTIONS

Most of us agree that stress, psychological conflict and/or an inability to express negative feelings have an unhealthy impact on us. Inhibiting emotions or failing to discuss a stressful event is a common occurrence. A Positive Behavioral Supports program can address the cause-and-effect relationship between

the occurrence of challenging behaviors and expression of emotions. Thus, preventive measures and solutions can be developed for the person in transition from high school to the adult world.

Fostering self-awareness through talking, writing or creating an artistic rendering of concerns and problems can help individuals feel better about themselves and reduce anxiety. In addition, we have seen encouraging results when teaching problem-solving, coping skills and self-management techniques simultaneously with the "feelings" work.

FEELINGS AND EMOTIONS: THINGS TO REMEMBER

- When left unexpressed, negative feelings and emotions can contribute to illness, accidents and challenging behaviors. Teach your child about the wide range of feelings and emotions.
- Help the individual understand the differences among feelings. Teach ways to express an emotion appropriately.
- Encourage people to express their emotions by talking, writing, using sign language or drawing pictures of what they are feeling.
- Help your young adult to discover the intent of the potential conflict and find positive alternatives for expressing stress and anxiety.
- Provide a safe opportunity for self-disclosure of feelings and emotions. Take time out to discuss these important issues as often as possible.

Social Pragmatics

Social pragmatics are social skills or interactions between speaker and listener that use words or expressions in a social context. Social pragmatics use experiential training to instill new concepts and are often highly successful in supporting the generalization of material.

SOCIAL PRAGMATICS: THINGS TO REMEMBER

- Use consistent, respectful and very specific feedback.
- Use role modeling in community-based settings in which social pragmatics are to be developed.
- Encourage self-management skills and inclusion in society. Skill areas are individualized and may include main-

PERSONAL INDEPENDENCE

THE EVERGREEN CENTER prepares students to lead meaningful lives in the community. Through an individual educational program combining basic skills and behavior development,our students learn to lead more independent lives as integrated members in the community.

Personalized Interdisciplinary Programs

HMS School for Children with Cerebral Palsy serves children with multiple disabilities resulting from cerebral palsy or traumatic brain injury who need comprehensive, individually structured programs that include:

Physical & Occupational Therapies
Special Education
Speech/Language Therapy
Music Therapy
Communication Aids
Special Medical Attention
Adapted Recreational Activities

Computer Technology
Communication Devices
Environmental Control
Powered Mobility

HMS, founded in 1882, is open to students two to 21 years. The experienced staff and well-respected consultants provide strong interdisciplinary programs for day and residential students at the licensed private school.

taining eye contact, sitting up straight, developing a well-modulated tone of voice, learning how to read the facial expressions and body language of others accurately and thinking before speaking.

- Feedback is essential and is best given verbally along with a behavioral checklist. This checklist works best when created with the young adult. It should be reviewed before and immediately after the social context in which it is to be used.
- Both positive and constructive feedback should be provided.

Self-Management of Daily Living

In order to develop healthy lifestyles in community-based settings, people must be given opportunities to make personal decisions about the direction in which their lives are headed. Individuals experience an increased sense of autonomy and tend to be more productive and happy when provided predictable and consistent opportunities in which to make choices and self-monitor activities.

STEPS TO SELF-MANAGE ACTIVITIES OF DAILY LIVING SUCCESSFULLY:

1. Make sure the activity is clearly presented and can be initiated at a set time and with a specific behavioral expectation.

2. Use something tangible, such as a behavioral check sheet, for self-monitoring. Your child must be able to see clearly when he or she has accomplished the task at hand.

3. Agree to expectations and a schedule for completion before beginning self-management tasks.

4. Provide an opportunity for self-evaluation and feedback.

5. Use a self-monitoring form to write down areas in which improvement has taken place. Review accomplish-

ments regularly and provide consistent positive verbal reinforcement.

6. Set goals for future activities.

STEPS FOR OBTAINING SERVICES DURING TRANSITION FROM HIGH SCHOOL:

1. Contact your local Developmental Disabilities Program or other state agency (e.g., Department of Health and Welfare or Department of Health and Human Services) to find qualified staff within the community.

2. Obtain additional contact information through the school district's main office, special education teachers or other special resource instructors. School personnel should be able to help with your child's transition and to assist with identifying resources that provide Positive Behavioral Supports or similar programs in your area.

3. Set up interviews to be conducted by you and your child to meet area service providers who would be the best "fit."

4. Upon initial referral, provide historical data about your child's disability to service providers.

5. Outline strengths, interests and needs of your child for service providers before meeting with them.

6. Find a trusted advocate such as a case manager, service coordinator or behavior consultant.

7. Once services are in place, set up regular monthly team meetings to insure consistency and follow-through in community-based settings.

8. Develop a Positive Behavioral Supports intervention plan.

9. Set up weekly sessions for your child with a behavior specialist if needed. ■

RESOURCES

Positive Behavioral Supports for Adults: *A hands-on training manual for Behavior Consultants and other professionals working with persons with challenging behaviors.*

The manual is a practical guide to working with adults with potentially challenging behaviors in an array of settings. Included are detailed instructions for formulating behavior plans, functional assessment of behavior protocols, and 47 reproducible forms for hands-on therapeutic activities. The manual is also helpful for parents as a resource guide. CDHD is offering the manual for half price ($20, including S&H) to Exceptional Parent readers. Please order before August 31, 2002.

To obtain a copy of the manual or to learn more about Positive Behavioral Supports for adults, contact:

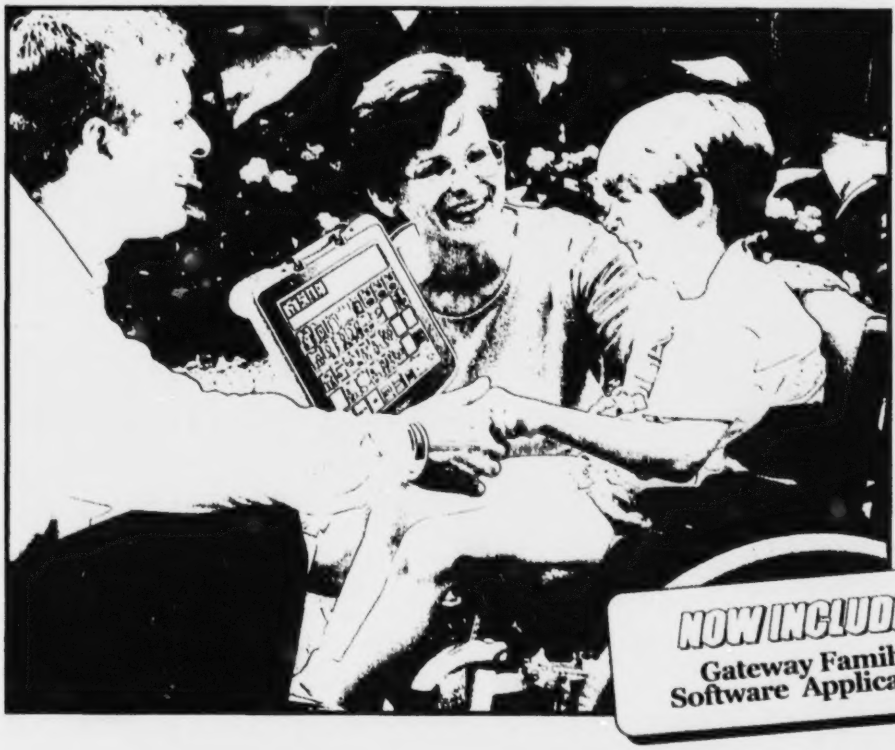
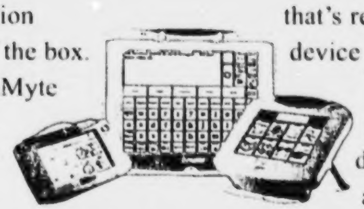
Communications for Life Just Got a Whole Lot Easier.



NOW INCLUDES...

Gateway Family of Software Applications!



Now even more DynaVox communication solutions are available to you right out of the box. When you order a new DynaVox or DynaMyte communication device, or DynaVox software from DynaVox Systems, you'll now receive Gateway to Language and Learning, Gateway 54 and Gateway Junior, all developed by Joan Bruno, Ph.D., CCC-SLP at no additional cost! Plus, as an added convenience, we will install all three Gateway software programs on the device before it is shipped to you. More communicators will enjoy all the benefits of having a pre-designed vocabulary system that's ready to use as soon as their DynaVox device arrives.

DynaVox products have been helping people to communicate for nearly two decades. All of the professional associates at DynaVox are committed professionals dedicated to preserving dignity and pride...offering compassion and understanding...providing first quality communication products for the ones you love the most.

By making Gateway part of the DynaVox package, we're staying in touch with the kind of communication solutions that professionals want and our customers need.

Understanding Transition Services:

A PARENT'S GUIDE

to Legal Standards and Effective Practices

by Gretchen L. Jefferson, PhD and Robert F. Putnam, PhD

Federal and state laws mandate transition service planning for students with special needs who are 16 years of age. Transition services are systematic, purposeful actions that are specified in Individualized Education Plans (IEPs) to prepare and support students with special needs in their transition from the school community to adult community living. The 1997 reauthorization of the Individuals with Disabilities Education Act (IDEA '97), a federal statute with a set of regulations that established guidelines for the delivery of special education services, defines transition services:

> *a coordinated set of activities for a student, designed within an outcome-oriented process which promotes movement from school to post-school activities including post-secondary education, vocational training, integrated employment (including supported employment), continuing and adult education, adult services, independent living, or community participation.* (*Code of Federal Regulations* [*CFR*] Section 602.30, Chapter 766)

These activities should be:

> *based upon the individual student's needs, taking into account the student's preferences and interests; and include instruction, related services, community experiences, the development of employment and other post-school adult living objectives and, when appropriate, acquisition of daily living skills and functional vocational evaluation.* (*CFR* Section 602.30)

Under IDEA '97, individuals with disabilities may remain in school until they graduate or turn 22.

What should transition services look like?

Transition services are considered to be a balance of teaching everyday living skills and teaching vocational skills. Several studies report that the unemployment rate for individuals with disabilities after leaving school ranges between 50 and 75 percent. One of the predictors of post-school unemployment is a lack of on-the-job experience while in school. Those students with work-study or paid work experiences tend to have higher rates of employment, better adjustment to the workplace, and higher incomes. Each student's ability to remain gainfully employed and to acquire other critical skills (e.g., social or daily living skills) has a direct impact on successful independent living.

Transition planning prepares students with disabilities to be competent in three skill areas in order to maximize integration into their communities: personal and social skills, daily living skills and occupational and vocational skills. Examples of the skills taught in each of these skill areas are presented below:

How is the transition plan formalized?

The transition plan is explicitly stated in the student's IEP. Because it will be the blueprint for all services, the IEP should be carefully developed. Although IDEA requires that transition services be formally implemented when students reach the age of 16, the student's IEP should be updated annually, beginning at age 14, to contain

This article is a result of a collaborative project of the Commonwealth of Massachusetts Department of Mental Retardation, the Ashburnham-Westminster Public School District and the May Institute.

TRANSITION SERVICES

PERSONAL/SOCIAL SKILLS

1. Maintaining hygiene/ appearance
2. Accepting praise/criticism
3. Situationally appropriate behavior
4. Interpersonal skills
5. Adequate communication
6. Problem-solving skills
7. Decision-making, self-advocacy, self-rights

DAILY LIVING SKILLS

1. Managing finances
2. Maintaining a home
3. Caring for personal needs
4. Buying/preparing food
5. Buying/caring for clothing
6. Recreation/leisure pursuits
7. Community mobility

OCCUPATIONAL/ VOCATIONAL SKILLS

1. Understanding and exploring occupational and vocational alternatives
2. Appropriate work habits/behavior
3. Marketable vocational skills
4. Job-seeking skills

> *a statement of the transition service needs of the child under the applicable components of the child's IEP that focuses on the child's courses of study (such as participation in advanced-placement courses or a vocational program)....beginning at age 16 (or younger, if determined appropriate by the IEP Team), a statement of needed transition services for the child, including, when appropriate, a statement of the interagency responsibilities or any needed linkages.* (*CFR* Section 614)

Transition service needs should be explicitly stated in the IEP as functional, measurable goals and objectives. Goals should target skill areas that are critical to successful transition (social, daily living, vocational). Functional goals and objectives include those that are based on the demands of adult life across a variety of settings. Measurable goals and objectives clearly state the criteria for success or "how far....by when." Here is an example:

	FUNCTIONAL AND MEASURABLE	NONFUNCTIONAL AND NONMEASURABLE
GOAL	The accuracy of Johnny's community banking skills will increase 50 percent over baseline levels.	Johnny will improve his banking skills.
OBJECTIVE	When Johnny makes a purchase using his debit card or checkbook, he will balance his checkbook immediately with 100 percent accuracy across five opportunities.	Johnny will complete banking worksheets with 80 percent accuracy.

To develop functional and measurable goals, begin with the student's present level of performance (PLOP) in all the targeted skill areas. The PLOP must be part of the IEP because it will be the baseline against which all progress will be measured. A comprehensive assessment of the student's skills is needed to determine PLOP. Assessment should include evaluation of performance in social, daily living and vocational skill areas.

Once the functional and measurable goals and objectives have been specified in the IEP, the issue of how to provide instruction in these skill areas must be addressed. To the greatest degree possible, instruction should occur in natural settings, such as a particular job site, grocery store or bank located in the student's community. When selecting these settings, identify and use locations, facilities and job sites that the student is most likely to access post-school. Attending to this detail will help provide a seamless transition when the student has completed school.

continued from page 71

Checkpoint

1. If your child is 14 years of age or older, does the IEP contain a statement of need for transition services?

2. If your child is 16 years of age or older, does the IEP specify which agencies will provide post-school services for him or her?

3. Is it clear from the IEP who is responsible for promoting progress toward transition goals?

4. Review each of your child's transition goals and objectives:

- Are goals stated in functional, measurable terms?
- Is PLOP based on recent assessments and is it clearly stated?
- Are the criteria for success clearly stated?
- Is training set to occur in natural environments (i.e., the community)?

When should you begin to plan for transition?

In deciding when to begin the transition planning process, it is important to consider the number of agencies involved in the student's care and the level of support assumed to be needed through adult life. If multiple agencies are involved in the student's care and you expect this involvement to continue through adulthood, begin transition planning in the early school years. If the student is at risk for dropping out of school or has severe cognitive or behavioral disabilities, it is critical to begin the planning process at an early age.

Some researchers suggest that vocational assessment—a critical component of transition planning—begin in the elementary grades by helping students develop interpersonal and decision-making skills and by ensuring that students have the opportunity to explore vocations and careers. This transition extends into middle school, where initial efforts are made to formally assess the student's interests, aptitudes, work habits, career maturity and development of job exploration and interview skills.

Once the student has reached high school, transition planning focuses on specific job training and obtaining employment, with evaluations of student performance made at the work site and through work samples. The objective of transition planning at the high school level is to promote a seamless transition. In order to ease the transition from high school to community living, students should spend increasing amounts of time in the community as each school year passes. By age 20, transitioning individuals should be settled into living arrangements and employment positions, and be familiar with community activities that they will access at age 22. This goal is accomplished by systematically including individual students in the community from an early point in the educational process.

Checkpoint

1. Is your child currently served by multiple community agencies?

2. If your child is 14 years of age, does s/he regularly participate in vocational activities in the community?

3. If your child is 18 years of age, does s/he hold a work position in the community?

4. If your child is 20 years of age, is s/he settled in the residence, job and community activities to be maintained as an adult?

Who should be involved in the transition planning process?

Families play an invaluable role in the transition planning process: they contribute knowledge of their children, affect their children's values and decisions (i.e., career, residence), and usually have continuous contact with their children throughout the transition. Research has shown that parental involvement is one key to successful transitions; another is student involvement. Students should be invited and encouraged to participate in transition-related activities so that they learn that transition is a process, self-advocacy skills are valuable and priorities and personal vision are important to the transition process.

Checkpoint

1. As parents or guardians, have you regularly attended your child's IEP meeting?

2. If your child is at least 14 years of age, has/she regularly attended IEP meetings?

3. If your child is at least 14 years of age, is a team of educational and community professionals available to assist in transition plan development?

4. What is the transition planning process?

A transition planning team may include any of these people: student; family members; general, vocational and special education teachers, school principal; school psychologist; vocational rehabilitation counselors; occupational and physical therapists; speech/language pathologist; community agency representatives; direct support professionals. A critical component of transition success is student and family involvement throughout the planning process. Nonschool personnel who will be involved with the individual student after s/he exits school should be involved in the process at least two years before that time.

The transition planning process can be thought of as a series of phases: planning and development, implementation, and outcome evaluation. Planning begins with establishment of a transition team, which is responsible for carrying out all three phases of transition. The team's initial task is to develop long-range community-living goals, while giving priority to the interests and preferences of the student and family. Once goals have been established, comprehensive assessments of student needs in all goal areas—social, daily living and vocational—should be conducted in order to determine the PLOP for each. Additional school and community professionals and agencies should be identified for potential involvement in the transition process.

Once all assessments have been completed, hold an IEP planning meeting with all team members to establish functional and measurable goals and objectives. Clearly state in the body of the IEP: what type of vocational experience the student will have; how many hours per week s/he will be working at the job site; the natural environments to be used for training; and which team members are responsible for implementation of training in each of the goal areas.

Implementation of the transition plan is the responsibility of all team members. Remember that, to the greatest extent possible, transition skills should be taught in the environments where students as independent adults will be expected to use them. Throughout implementation of the transition plan, progress toward transition goals should be measured regularly, whether daily, weekly or biweekly. Progress monitoring will provide team members with the information needed to adjust instructional programs to ensure that the student is progressing at a rate that will meet the annual transition goals. Alterations in goals may include a change in the level of support given to the student, especially in the area of employment; for example, a change may be a move from a sheltered workshop to supported employment, or additional coaching at the current site. Transition goals and objectives also should be adjusted to meet the changing community-living goals of students and their families.

Ongoing data collection on progress toward transition goals allows team members to track progress on a daily, weekly or biweekly basis and is the best way to evaluate

TRANSITIONING

continued from page 73

outcomes. Progress data should be used to change instructional programming, modify existing goals and establish new ones. How quickly and effectively a program adjusts to the needs of a student is an indicator of the quality of the program.

Checkpoint

1. Does my child have a transition team?

2. Do the assessments to be given evaluate areas needed for transition?

3. Are PLOP, functional and measurable goals, responsible persons and time in the community clearly specified in the transition plan?

4. Have outcome measures and the frequency of progress monitoring been specified in the plan?

5. Are we as parents satisfied that this transition plan meets the transition needs of our child?

Effectiveness of current transition services

Programs associated with successful post-school outcomes typically include outcome-based evaluation, inclusion in school and community, community-referenced instruction/curriculum, person-centered transition planning, job placement prior to graduation and family involvement. These services should produce measurable progress during the post-school years in the individual's success in:

- the ability to use community resources such as banks or transportation;
- establishment of employment participation in a social network; and
- independence with lifestyle choices.

Critical components of effective services include the determination of measurable objectives and the assessment of the interventions' effectiveness in achieving progress towards these objectives. Staff working with students in transition will need the ability to develop measurable objectives, and to use data collection and task analytic strategies to determine the efficacy of the interventions provided. Furthermore, standardized adaptive behavior assessments such as the Scales of Independent Behavior-Revised or the Vineland Adaptive Behavior Scale may be conducted on an annual basis.

In order to ensure that students are assisted in reaching the greatest level of self-sufficiency and involvement in their communities, it is crucial to use practices with a documented history of effectiveness. Thus it is recommended that staff working with students with developmental disabilities

continued on page 76

Effective Practice Transition Planning Checklist

Outcome-based evaluation

1. Goals and objectives are written in measurable terms.

2. Data collection systems are in place to measure progress toward each of the goals/ objectives.

3. These data are reviewed at least twice monthly to evaluate progress.

4. Changes are made to instructional strategies or goals as indicated by the data.

Inclusion in school and community

1. Educational activities occur in natural settings.

2. Each year, the time spent in the community increases.

3. Community agencies are active participants in the transition process.

4. Barriers to community living are addressed in the transition plan.

5. People who are 20 years old are living, working and involved in the community activities in which we expect them to be living, working or involved at age 22.

Community-referenced instruction/curriculum

1. Transition plan goals address all areas of need for the transition process, including social, daily living and vocational skill areas.

2. Transition plan goals and objectives are functional.

3. Transition services promote social inclusion and the rights of the student.

Person-centered transition planning

4. Transition plan goals are based on our child's and our family's goals in the areas of social development, daily living skills and job preferences and aptitude.

5. Goals are changed to reflect changes in personal choice.

Job placement prior to graduation

1. Opportunities to learn about future employment options are planned/provided.

2. Jobs students have just prior to graduation are the jobs they are expected to hold at age 22.

3. At age 18 and beyond, our child has an employment position.

Family involvement

1. As parents, we have discussed important transition issues with our child.

2. As parents, we are invited to each planning meeting.

3. As parents, we attend all of our child's planning meetings.

4. Our child attends all planning meetings.

5. Our opinions are solicited and valued at these meetings.

6. The transition plan reflects our input.

Trained staff

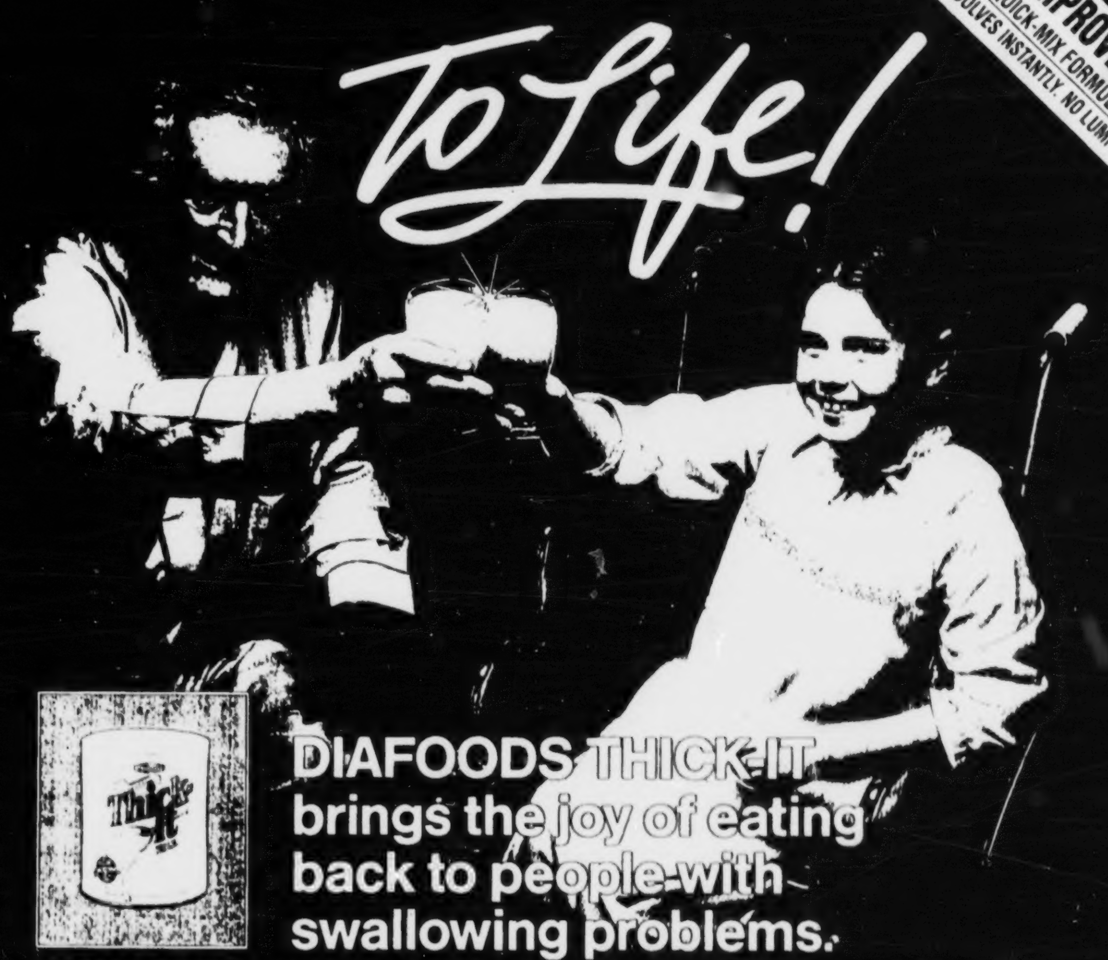
1. Staff training involves both didactic training and case-based—or student-specific—consultation to ensure use of the most effective instructional strategies.

2. Staff are trained in applied behavior analytic procedures.

3. Staff receive an adequate level of training from professionals who are qualified in applied behavior analysis.

4. Staff across settings are trained to promote the generalization and maintenance of skills.

NEW IMPROVED
QUICK-MIX FORMULA
DISSOLVES INSTANTLY. NO LUMPING.



DIAFOODS THICK-IT brings the joy of eating back to people with swallowing problems.

Here's the solution for the millions of young and old who need modified consistencies to enjoy eating.

DIAFOODS THICK-IT, when mixed with hot or cold, thick or thin liquids and pureed foods, produces any desired consistency quickly, easily and controllably. But it does not change the taste or appearance of the food it thickens.

DIAFOODS THICK-IT adds sixteen calories per tablespoon for nourishment but is very low in sodium for people on sodium-restricted diets. And it helps hydrate patients because it will not bind water or fluids.

DIAFOODS THICK-IT is the market-maker and the #1 selling brand of Instant Food Thickener. It is recommended by speech and language pathologists, dietitians and nutritionists in hospitals, nursing homes and rehabilitation facilities across the country.

For product literature and advice, a free sample and information where **DIAFOODS THICK-IT** may be purchased, **call... (800) 333-0003.**

Free educational material, call... (800) 333-0003.

The booklet **"Dysphagia, A Review For Health Professionals"** discusses causes, evaluation and treatment of dysphagia.

The pamphlet **"Swallowing Problems"** helps patients and caregivers understand and adapt to dysphagia.

continued from page 74

develop competencies in the use of applied behavior analytic procedures. Applied behavior analysis is a highly individualized method of instruction based on scientific principles of learning theory. It is used to design student-specific programs that are implemented systematically, evaluated empirically, and introduced within natural environments. It matches teaching and intervention strategies to the unique learning style of each student. Because data are reviewed continually and adjustments are made ad hoc, interventions can remain effective and tailored to the needs of the individual. More than 25 years of research have validated this method as the most effective way for individuals—with and without disabilities—to acquire skills, increase socially useful behaviors and reduce problematic ones.

Students with developmental disabilities do not automatically generalize skills from one setting to another. Research has shown that in order for generalization to occur, it must be programmed; parents and staff across settings will need to be trained in order to help the student acquire skills. Educational services are only truly effective if they produce benefits in other settings and with other people. To increase the student's ability to generalize skills outside the classroom, it is important that teaching occur in a variety of natural settings where the student would use the targeted skills, such as a restaurant, grocery store or bank. Instruction should be community-referenced. This will be vital in determining whether the student has successfully mastered the skill. The acquisition of skills may be enhanced by eliminating the steps needed for generalization.

Effective services promote social inclusion and the rights of young people; students' learning experiences should include instruction in decision-making, self-advocacy, and self-protection and training in their rights.

Effective transition services require extensive staff training to assure that staff use the most up-to-date techniques available. Training should include both didactic instruction and case-based, competency-based consultation, so that staff members develop measurable competencies rather than simply log hours of training. For competency-based training, needed skills are task-analyzed into a checklist. Ongoing training and consultation are provided to reinforce competence in the needed areas. Because individuals with developmental disabilities present extra challenges, professionals who are qualified in applied behavior analysis and have a specialty in the individual's area of presentation should provide staff training.

To evaluate a secondary school's transition services, gather information about a program's success in implementing all of these effective practices. Schools that use the most effective instructional strategies and staff training methods are likely to achieve the most positive, measurable outcomes. *The Effective Practice Transition Planning Checklist* on page 74 may be used to evaluate how closely your child's transition services reflect both legal standards and effective practice.

Resources: For information about how to identify qualified professionals in applied behavior analysis, please refer to *Identifying Qualified Professionals in Behavior Analysis and Behavioral Intervention for Young Children with Autism*, edited by Maurice, Green and Luce. research reflections

Hooray for Hollywood...

New Feature Film *Pumpkin* Confronts Sexuality and Developmental Disability

by Jan Blacher, PhD

Pumpkin

It's about time the young man with a developmental disability gets the girl! So it plays, as the new feature film *Pumpkin* (United Artists) inadvertently advances a research and policy agenda. *Pumpkin*, which was featured at the 2002 Sundance Film Festival, is scheduled to open in theaters in late June. The film is written by Adam Larson Broder and co-directed by Broder and Tony R. Abrams.

In the film, Jesse Romanoff, a.k.a. "Pumpkin" (played by Hank Harris), is a young adult portrayed as having mental retardation and some physical impairment. Christina Ricci stars as Carolyn McDuffy, a college student whose sorority has adopted the "Challenge Games" (modeled loosely after Special Olympics) as its charity. As part of her volunteer activities, Carolyn begins to work with Pumpkin, who is one of the athletes. Over the course of the movie, Carolyn grows disaffected with her well-built and handsome tennis-star boyfriend, the shallowness of her sorority sisters, and the crudeness with which many of her friends refer to persons with retardation. Meanwhile, her interest in Pumpkin increases; she becomes enamored with his sweetness and apparent goodness in contrast to the jaded and self-serving values of everyone else around her.

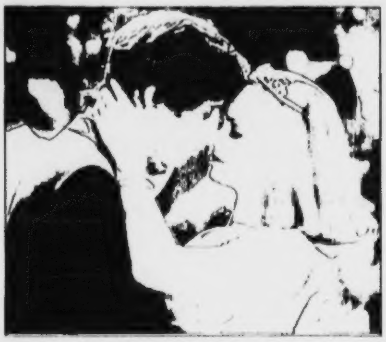
Christina Ricci's performance as an impressionable young woman who is confused, idealistic and driven to "do the right thing" by her emotions and romanticism is highly believable. The relationship between Carolyn and Pumpkin deepens and, eventually, is consummated. There is great awkwardness when they are discovered in bed by Pumpkin's mother, Judy Romanoff (played brilliantly by Brenda Blethain), who feels that Carolyn essentially raped her son.

What distinguishes *Pumpkin* from other Hollywood films (e.g., *The Other Sister* or *I Am Sam*) is that it is not didactic. It does not portray developmental disability as a huge obstacle to be overcome, nor is it painfully saccharine. Rather, the story itself is a dark comedy in which Pumpkin's developmental disability—and how people treat him because of it—acts as a prism through which to view the personality and character flaws of other individuals (who are portrayed in almost-fairy-tale stereotypes).

To place disability and film in context, Stephen Safran, who is a professor of special education at Ohio University, has investigated the frequency of Academy Awards given for Best Picture, Best Actor and Best Actress for films that feature individuals with a disability. In a 1998 paper in *The Journal of Special Education*, Safran cites statistics that demonstrate a dramatic increase in filmmakers' interest in disabilities over the past several decades. In the 1930s, 3 percent of the Academy Awards went to movies involving disability; in the 1990s, 44 percent of the awards did so. The most common disabilities portrayed in films are psychiatric in nature (52 percent), followed by physical disabilities (20 percent) and then sensory impairments (16 percent). Disabilities involving specific intellectual impairment, such as autism, mental retardation or overall developmental disability, are less frequently portrayed, but recent examples include *Forrest Gump* and *Rainman*.

In this growing company of films about persons with disabilities, *Pumpkin* stands out for its complex subject matter. The film not only introduces the viewer to a likable

Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, and had been a researcher for more than 25 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of retardation, dual diagnosis and the transition to adulthood. Dr. Blacher has developed **Research Reflections** as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to **Research Reflections** and any suggestions you might have. Send e-mail to: jan.blacher@ucr.edu.



young man who happens to have a physical and a cognitive impairment, but it also confronts unresolved issues around sexuality and disability—a subject few other films have approached.

Sexuality is often denied. One way to deny that sexuality exists is to treat an adolescent or young adult with mental retardation as an innocent child. Ever since Jesse Romanoff was a little boy, his mother referred to him as "Pumpkin," a term of endearment. That she still does it seems inappropriate, yet it is one way she can keep her "little pumpkin" from growing up. Her tone of voice in addressing Pumpkin, as well as her resistance to allowing him any heterosexual encounters, contributes to his infantilization. By failing to consider Pumpkin's chronological age and, to some extent, his cognitive capabilities, and despite overwhelming evidence to the contrary, she can ignore any desire he may have for a sexual relationship and any need he may have for sex education. In addition to Pumpkin's obvious crush on Carolyn, his mother finds him looking at a centerfold in an adult magazine, which suggests that he not only has a

continued from page 79

desire for information about sex, but also knows where to find it.

Denial of sexuality is discussed by Vicki Lumley and Joseph Scotti in their 2001 article in the *Journal of Positive Behavior Interventions*. They cite research indicating that some parents and direct support professionals (DSPs) believe that proactively providing sex education will produce negative outcomes in the form of promiscuous young adults. However, the literature contains decidedly different views on this topic. In their article "Construction of Adulthood and Disability," which was recently published in *Mental Retardation* (2001), Barbara Jordan and Glen Dunlap sensitively consider the rites, roles and rituals of becoming an adult. As Barbara Jordan writes, reflecting on her daughter's sexuality:

> *...I believe equal opportunity is what she would want if she could advocate for herself. I have had significant difficulty envisioning my daughter accessing some of the traditional markers of adulthood. However, the issue is not whether I find it difficult to envision my daughter having sex or getting married, but whether it is something that she may want to do.*

One might well ask why individuals with mental retardation or other developmental disabilities should be held to a higher standard than the rest of the population.

Consider the fact that Barbara Jordan's daughter, Cassandra, is described as having a severe cognitive impairment; in the movie, Pumpkin's level of intellectual ability hovers just around the threshold for diagnosing mental retardation. Though his observable behaviors closely resemble those of his "typical" peers, his mother's longing to protect him produces an overly restrictive home environment.

Sexual consent is a murky concept. There will always be a struggle to achieve balance between protecting individuals with intellectual disabilities from harm and restricting their access to sexual activity. In a review of *Pumpkin* published in the *New York Post* (January 16, 2002), film critic Lou Lumenick states that the movie raises "questions about the athlete's sexuality and whether he's capable of informed consent [...] making some viewers uncomfortable." Clearly, Mr. Lumenick squirmed in his seat, even in light of the carefully placed evidence of Pumpkin's capacity for sexual consent. When Mrs. McDuffy asks her daughter Carolyn if Pumpkin had raped her, Carolyn emphatically replies, "It was consensual."

What does the prevailing research tell us about the capacity of persons with intellectual impairment to give sexual consent? Researchers Carrie Kennedy and John Niederbuhl surveyed 305 members of the American Psychological Association on this issue. They administered a questionnaire that contained 56 items, and asked respondents to rate the perceived importance of each item for determining capacity for sexual consent. The researchers determined that the 56 items reflected five broad dimensions: 1) the consequences of sexual activity; 2) essential sexual knowledge; 3) unessential sexual knowledge; 4) safety for self and others; and 5) basic safety skills. Items the psychologists considered most important for determining capacity evaluations included understanding the consequences of one's sexual activity and being able to protect oneself. However, items related to moral dimensions were not rated in the "important" range.

The researchers recognized that criteria for consent capacity vary widely across states. For example, some states require individuals to understand the nature of their sexual conduct and the possible consequences of their actions, as well as to appreciate the moral dimensions of their sexual activity. One might well ask why individuals with mental retardation or other developmental disabilities should be held to a higher standard.

These may be difficult issues to think about for parents of exceptional children; they are difficult for parents to think about vis-à-vis any child! Like Mrs. Romanoff in the film, Barbara Jordan confesses, "I have been neglectful in educating Cassandra about sexual issues."

Researchers, professionals, parents and DSPs need to look frankly and openly at sexuality and disability. We need to try to reach some agreement about supporting healthy sexual expression for persons with mental retardation/developmental disability. Recently, a special interest group on social and sexual concerns of the American Association on Mental Retardation (AAMR) issued a policy statement on sexuality. The overall position is that "every person shall have the right to exercise choices regarding sexual expression and social relationships." Obviously, individuals with mental retardation/developmental disabilities, and their parents and DSPs, need access to education about the associated rights and privileges that support this position. Fortunately, progress is being made on three fronts:

(1) The professional literature contains papers on individualized programming that incorporate sex education, including programming within a person-centered planning framework. However, we need better, published evaluation research on the effectiveness of curriculum programs currently in use, as well as guidelines for their application. In addition, we need more data-based studies that address the understanding of sexuality and consent issues by specific groups of adolescents and young adults with cognitive limitations.

(2) There are excellent examples of appropriate programming currently in use. For instance, the "circles concept" developed by Leslie Walker-Hirsch and associates focuses on the teaching of adaptive skills needed for social/sexual development. Bancroft NeuroHealth, a large service provider in Haddonfield, New Jersey, has a well-developed Social/Sexual Policy and Training Program for continual staff training and ongoing education for the individuals served by this organization.

(3) There are also commercially available materials on the moral, social and legal aspects of sexuality. For example, the James Stanfield Publishing Company has materials on the moral, social and legal aspects of sexuality. They produce training and educational materials on many topics for and about people with disabilities and special healthcare needs.

Since the movie-going public receives a fair amount of its education on exceptionality at the cinema, we look to writers and directors to deliver their material—however creative or fictional—with veracity, honesty and common sense. *Pumpkin* will likely be heralded by persons with developmental disabilities. While it may be dreaded by their parents, they can always tell themselves, "It's only a movie!" EP

Dr. Blacher was the Research Consultant for Pumpkin, and was a participant at the screenings and press conferences on the film at the 2002 Sundance Film Festival.

Liberty Motors

Liberty Motor Company provides affordable, reliable and safe transportation alternatives.

The Liberty Motor Company is dedicated to improving the lives of persons with disabilities, by providing affordable, reliable and safe transportation for individuals with mobility impairments that require the use of a wheelchair or scooter, across the continent.

With Liberty's exclusive dedication to the Ford Windstar, it has been successfully adapting the minivan for wheelchair accessibility since its inception in 1995. Liberty took a unique approach by seeking the advice of those who use wheelchairs, learning what aspects of the vehicle modification were considered to be of priority concern, and which features were preferred to accommodate the varying needs of its customers. After countless focus groups and prototypes, Liberty developed a revolutionary rear-entry passenger van, incorporating vast experiences and expert design techniques. Liberty's passion to provide a better product and service paved the road for other companies to adopt some of these new technologies and business practices, resulting in dramatic overall improvements in the accessible vehicle industry.

The Liberty Motor Company has two main objectives when manufacturing its product. To keep those using its product safe, while preserving a pricing structure that allows Liberty to provide solutions to people with budget limitations. Among the reasons that Liberty chose to exclusively modify the Ford Windstar was its consistent mechanical reliability, and industry-leading 5-Star crash-test rating. These Windstars are not only safe, but offer the same ride and handling characteristics as a standard minivan, providing for a quiet and comfortable journey. The counter-balanced manual ramp system is virtually effortless to use, and requires little training and no maintenance, ensuring many years of trouble-free transport.

The low-floor rear-entry design includes a custom heavy duty suspension for a comfortable, yet durable ride. The option of a high-capacity rear air-conditioning/heating system ensures that all vehicle passengers enjoy a pleasant atmosphere, regardless of weather conditions or geographic location. Liberty's modified Windstars provide capacity for up to 6 individuals, while offering the flexibility to accommodate up to two wheelchair users, providing the ultimate solution to a variety of needs or circumstances.

The manually operated ramp system eliminates the need for maintenance and the risk of breakdowns. All vehicles are built to meet the ADA (Americans with Disabilities Act) standards, and undergo numerous crash-testing and safety approvals, assuring a safe and comfortable ride for all types of mobility devices.

Another strength of the Liberty Motor Company is its dedication to those who have special needs. A new component to be launched on Liberty's website http://www.libertymotorco.com is a detailed database for assistance programs across North America, helping those in need of financial aid for purchases of mobility equipment.

From a commercial perspective, Liberty combines its efforts with the taxicab and paratransit industries toward the goal of improving public transportation for persons with disabilities. Though its grassroots efforts, Liberty is committed to communicating these needs throughout the various levels of government, in an ongoing pursuit to ensure that all communities are properly served with affordable, accessible transportation. Retirement homes have found the addition of Liberty Motor Company vehicles to be a worthy investment. By offering a service that allows its residents to attend appointments on short notice, or simply just to enjoy a day in the local park, options are created that are proven to increase their quality of life.

Liberty has also established itself across North America as a primary supplier of practical, reliable vehicles to special care patients at an affordable price. Liberty's government interaction has helped facilitate an awareness of the needs of the community of persons with disabilities across North America. Liberty has been instrumental in helping to ease restrictions to provide cost-effective vehicles for individuals and the commercial transportation industry across the continent.

Liberty Motor Company is the highest volume supplier of rear-entry accessible vehicles in North America. In developing a high-volume, streamlined operation with an aggressive pricing structure, new opportunities are available to suit almost any budget. By maintaining constant inventory of between 50 and 100 vehicles in a variety of option and color configurations, your choice of the safest, most reliable wheelchair accessible vehicles is simply a phone-call away.

The Liberty Motor Company's unique corporate strategy ensures that it will remain a leader within the industry for many years to come. Its unique advantages in combining high-volume purchasing, streamlined production, direct distribution and innovative sales techniques allow the Liberty Motor Company to continue to break new grounds in the accessible vehicle industry, providing the highest quality, safest and most reliable vehicles, with the lowest pricing in the industry.

Vantage Mobility International

Vantage Mobility International (VMI) is the world's premier manufacturer of mini and full size wheelchair accessible vans. VMI's purpose is to provide the highest quality products to enhance the lives of the physically challenged. In addition to manufacturing the most reliable products on the market, customer satisfaction, safety and service are of the utmost importance. VMI is proud to have developed satisfied and loyal customers whose lives have been greatly enhanced by the use of their van conversions.

Because safety and reliability are of the highest importance, all of VMI's van conversions are crash-tested and retain the manufacturer's warranty after the conversion. Product offerings include conversions on Ford, Chrysler and Dodge mini vans and Ford full size vans. Mini van conversions include a choice of Northstar, the revolutionary automatic in-floor-ramp system, the Northstar E-Series, a manual version of the Northstar and the Summit, a revolutionary bi-fold ramp system. The Ford full size van conversion includes either an under-the-vehicle or an in-cabin lift.

In addition to van conversions, VMI manufactures exterior power scooter lifts and interior power wheelchair and scooter lifts: the Excel, Excel E-Series and the Outback. The Excel is an inside mounted scooter and wheelchair lift with a 350-lb. lifting capacity and is the only lift to feature a keychain remote control. Coupled with its stylish design, easy installation, and emergency release, the Excel is the fastest growing lift on the market. The Excel fits comfortably in most SUV's, minivans and full-size vans. The Excel E-Series is an economical manual version of the Excel that retains the Excels powerful lifting capacity and stylish design. The Outback is a sturdy exterior scooter lift that fits both 3 and 4 wheel scooters and automatically stows in the upright position. It has a unique design with dual hold down arms, a "stabilizing pin" to reduce rattles and sway and a swing-away option. The Outback's durable anti-slip platform and all-steel, weather-tight construction ensures years of reliable use. All VMI lifts are eligible for reimbursement of up to $1000 from GM, Ford, Daimler/Chrysler, Saturn and Volkswagen, under the terms of their mobility programs.

YouCan HAVE THE BEST

Reliability.

Northstar, America's favorite in-floor ramp system, featuring a 10" lowered floor and 58" of headroom, provides an obstruction-free doorway. With standard One-Touch control, just a single touch of the remote silently deploys this reliable ramp.

NATIONAL SPORTS FESTIVAL FOR THE DISABLED SLATED FOR JUNE

The National Sports Festival for the Disabled, the nation's biggest event for athletes with physical disabilities, will take place June 24-July 1, 2002, in New London, CT, bringing together several hundred athletes with disabilities from approximately 40 states to compete in national championships and open competitions.

The National Sports Festival, a registered trademark of the US Olympic Committee, is affiliated with the National Disability Sports Alliance (NDSA). Both organizations provide competitive opportunities for athletes with physical disabilities, just as the Special Olympics movement provides similar opportunities for people with mental retardation. Athletes competing in the National Sports Festival typically have such disabilities as spinal cord injury, amputation, visual impairment, cerebral palsy and traumatic brain injury. The Festival has drawn international recognition and participation; previously it played host to the US Paralympic Team track and field trials for the 2000 Paralympic Games held in Sydney, Australia.

The NDSA is responsible for conduct and administration of approved sports in the United States. NDSA formulates the rules, implements policies and procedures, conducts national championships in twelve sports, disseminates safety and sports medicine information and selects athletes to represent the United States in international competition. NDSA is a Community Based Organization (CBO) member of the United States Olympic Committee.

The 2002 National Sports Festival will feature two National Championships. First is the NDSA's Junior & Adult National Championships, for athletes ages 7 to adult, with competition in bocce, bowling, cross country, swimming, track and field, powerlifting and indoor wheelchair soccer. The second is Wheelchair Sports USA's Junior National Wheelchair Championships, featuring archery, swimming, table tennis, track and field and weightlifting for athletes ages 6 to 21.

For athletes not competing in the National Championships, open competitions will be held at the Junior level (ages 7 to 18) in bowling, cross country, swimming, track and field and indoor wheelchair soccer. Open Adult Competition includes bowling, track and field and indoor wheelchair soccer.

Open competition in International Paralympic Committee-sanctioned powerlifting will also be held for athletes from all physical disability groups, ages 16 and older.

Competition venues for the National Sports Festival will be the athletic facilities of Connecticut College. During the Festival, competitors and their families will have access to

Ocean Hyperbaric Neurologic Center

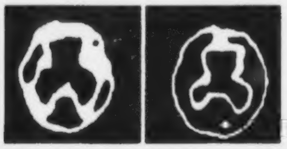
Positive Transitions Resulting from Hyperbaric Oxygenation Therapy

Hyperbaric oxygenation often causes a positive transition for children with cerebral palsy and brain injury. At a symposium sponsored by the Ocean Hyperbaric Neurologic Center last July,* doctors from 14 countries spoke on the benefits of hyperbaric oxygenation in hundreds of children with these conditions. The main transitions were: 1) reduction of spasticity; 2) increased cognitive function; 3) improved fine and gross motor control; 4) improved nutrition and normalization of bowel habits.

At the Ocean Hyperbaric Neurologic Center, we have seen many positive changes take place; some profound. A little boy with microcephaly had his head circumference return to normal (the fontinellas had not yet closed). A three-year old with stroke from umbilical cord around the neck arrived in a wheelchair and was able to run around by the end of treatments. Other children with speech and learning disabilities showed positive transitions approaching normal. Seizure disorders are also treated, and in many cases result in a reduction in frequency and/or severity of seizures, and often anti-seizure medications are reduced or stopped.

As noted previously, transitions from coma, although at times slight, are wonderful for the family and very cost effective.

All of the patients at our center have been validated with functional brain imaging, which measures blood flow and metabolism via SPECT (Single Photon Emission Computerized Tomography) scans. Results from a joint venture with Nova Southeastern Medical School has shown that there is a high statistical correlation between the changes in blood flow produced by hyperbaric oxygen and the clinical condition.



(Red indicates improvement)

social activities featuring the sights and sounds of Connecticut. Major sponsors of the National Sports Festival include Connecticut Institute for the Blind/Oakhill (CIB), The Hartford, Mohegan Sun, U.S. Food Service/Norwich, Hanger Prosthetics and Orthotics and Southern New England Telephone. The National Sports Festival is also supported by the Village Print Shop, Bristol Meyers-Squibb, the Tolland Fund, Inc., SNET Pioneers, Ohio Willow Wood, Hospital for Special Care, Banana Boat and Coca-Cola.

Admission to the National Sports Festival is free for the public. Athletes must be members in good standing of the National Disability Sports Alliance (NDSA) (formerly USCPAA) or Wheelchair Sports USA (WSUSA). Entry fee for athletes is $100 before May 24; after that date the fee is $125.

For more information, contact:
the National Sports Festival at: (860) 267-6757;
Web site: http://www.nationalsportsfestival.org.

Child Health Monitor and EP Form International Strategic Alliance

EP has formed a strategic alliance with ChildHealthMonitor.org (CHM)—a Web-based company in Australia. CHM reviews the most recent issues of the 11 leading medical journals on child and adolescent physical and psychological health from the USA, Europe and Australia, plus the four leading general medical journals from Europe and America. Articles based on their reviews are then posted on CHM's subscriber Web site.

Starting in June, EP and CHM will develop a co-branded Internet channel for families and professionals, where selected articles from CHM's archive will be posted. There will also be special offers from CHM and EP such as discounted bundled subscriptions and book sales. For more information, see the EP Web site, http://www.eparent.com.

S.O.F.T. 2002 CONFERENCE

S.O.F.T. (Support Organization For Trisomy 13, 18 and related disorders) is a nonprofit organization offering support for parents who have had a child with a chromosome disorder, and education for families and professionals interested in the care of these children. Since 1987, S.O.F.T. has hosted an annual national conference; this year it will be held July 10-14 at the Oak Lawn Hilton, Oak Lawn, IL.

To request information about **S.O.F.T.** and the conference, contact:

S.O.F.T.
(800) 716-SOFT(7638)
E-mail: barbsoft@aol.com
Web site: http://www.trisomy.org

familiar faces

BENJAMIN

The Tepper brothers, Benjamin (left) and **Matthew** (right) love to be together. Benjamin was born with an undiagnosed genetic disorder which left him with global developmental delays. He receives physical, occupational and speech therapy, as well as special instruction at home. *Teletubbies* is his favorite TV show! His mother Pam reports that Matthew continues to be Benjamin's biggest motivator.

LANCE ALEXANDER

Lance Alexander Humphrey, 10, is a fun-loving little boy who loves concerts, the movies, going bowling and visiting fairs and the mall. He has been in school since he was 2 years old and enjoys it. Lance has cerebral palsy and multiple disabilities, including blindness, scoliosis and kyphosis. He uses a few words and sometimes repeats after his family.

KIM

Kim Hoang is learning to drive her power-chair. Kim has cerebral palsy and enjoys her weekly session of water therapy. She also enjoys spending time with friends. She was born in Vietnam and has lived in the United States for 16 years. Her guardian writes, "Kim is a joy and spreads smiles to everyone she meets."

COLTEN

Colten Conner, 2, enjoys watching TV, playing with his daddy and spending weekends with his grandparents. Colten has microcephaly, cerebral palsy, myoclonic seizure disorder and cortical visual impairment. He lives at home with his parents, Melissa and Mike.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (EXCEPTIONAL PARENT), 65 E. Route 4, River Edge, NJ 07661. (Please do not send originals or "one-of-a-kinds," as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

LEGISLATIVE UPDATE

TICKET TO WORK PROGRAM GETS DOWN TO BUSINESS

Ticket to Work, a voluntary program under the Social Security Administration, hopes to put more people with disabilities to work. Beginning this year, the program will provide people who receive disability benefits (Social Security or Supplemental Security Income [SSI]) with a Ticket that may be used to obtain vocational rehabilitation, employment or other support services from an approved provider.

How the Ticket works

Individuals may take their Ticket to any of the employment service providers—called Employment Networks—who offer services in their communities. A list of participating networks can be found at http://www.ssa.gov/work. Together, the Network and the Ticket holder design an individual employment plan which will assist the Ticket holder in reaching his or her employment goals.

Since the program is voluntary, people who receive a Ticket are not required to work and Employment Networks are not required to accept Tickets. Ticket to Work is intended to give people with disabilities more choices in achieving self-sufficiency and opportunities for finding and keeping a job. The services of an Employment Network are provided free of charge to Ticket holders.

Coming to a mailbox near you

The program will launch across the US and territories in three phases, the first of which began in February. By rolling out the Ticket program in phases, the Social Security Administration will be able to evaluate the program and make any necessary improvements before it is fully implemented. The SSA will hold Quarterly Meetings which will serve as conduits for ongoing evaluation (see below for schedule).

Tickets will mail out based on the last digit of a beneficiary's Social Security number. In the first phase mailing, the Tickets will reach 2.4 million beneficiaries in 13 states—Arizona, Colorado, Delaware, Florida, Iowa, Illinois, Massachusetts, New York, Oklahoma, Oregon, South Carolina, Vermont and Wisconsin.

The second phase, scheduled for late 2002, will initiate Alaska, Arkansas, Connecticut, Georgia, Indiana, Kansas, Kentucky, Louisiana, Michigan, Mississippi, Missouri, Montana, Nevada, New Hampshire, New Jersey, New Mexico, North Dakota, South Dakota, Tennessee, Virginia and the District of Columbia.

In 2003, the final phase covers Alabama, California, Hawaii, Idaho, Maine, Maryland, Minnesota, Nebraska, North Carolina, Ohio, Pennsylvania, Rhode Island, Texas, Utah, Washington, West Virginia and Wyoming, as well as American Samoa, Guam, the Northern Mariana Islands, Puerto Rico and the Virgin Islands.

Removing barriers to healthcare

Ticket to Work program is an important part of the Ticket to Work and Work Incentives Improvement Act of 1999. In addition to the Ticket program, the law includes other provisions, such as expanded healthcare coverage. In the past, many people with disabilities had to choose between qualifying for healthcare coverage and having a job.

In effect since October 1, 2000, the law expands Medicaid and Medicare coverage to more people with disabilities who work. States may provide Medicaid coverage to more people who are still working. States also may permit working individuals with income above 250 percent of the federal poverty level to purchase Medicaid coverage. Most people who receive SSI benefits are eligible for Medicaid, a state health benefit. These individuals should contact their state's Medicaid office for more information. Other provisions in effect since January 1, 2001 under the law include expedited reinstatement of benefits for individuals whose coverage ended because of work and deferral of medical disability reviews for individuals using a Ticket.

Open for feedback

The Office of Employment and Support Programs of the Social Security Administration will hold public Quarterly Meetings around the country focusing on issues related the Ticket to Work Program and the Ticket to Work Incentives Improvement Act. The remaining meetings scheduled for 2002 include:

May 14-16 in New York, NY (This meeting will have special emphasis on issues related to youth with disabilities and transition from school to work.)
August 20-22 in Washington, DC
November 13-15 in Albuquerque, NM

For more information or to learn how to obtain a ticket, call the Ticket to Work Helpline toll-free: (866) 968-7842; (866) 833-2967 (TDD). ■

Who will care for your disabled child when you are gone?

**Litigators Incorporated, P.C.
& Affiliated Law Firms**

ATTORNEYS ACROSS THE NATION

Dear Parents:

My sister died leaving behind a disabled child. If you have a child with a disability, the obligation for his or her care continues even after you are gone. My name is Jeff Brody, President of Litigators Incorporated, P.C. Let us help you find out if your child's disability was preventable; you could be entitled to substantial compensation for the lifetime care of your child. You owe it to your child to protect their future. There are time limits, please call me

"Reel Life"

By Roseann Forziano

I see Sean Penn has turned in an Oscar-caliber performance in his new movie *I Am Sam*. I had predicted his nomination just from its one-sentence synopsis in the local paper: "Mentally challenged father fights to retain custody of his daughter." A number of years ago a pre-Oscar broadcast of the *Today Show* featured a reporter from *Variety* setting odds for predicting each contender's Oscar chances. This hip Hollywood type informed us all that "if you play a retard, you get nominated." Although this type of insensitivity deserves an entire essay itself, my immediate concern is a different one.

What prompts me to write now is the portrayal, once again, of individuals with developmental disabilities as sweet, somewhat befuddled, oddly-dressed angels who only need an understanding and well-meaning "normal" person to make their lives into happy imitations of "normal life." I know that I should be grateful that TV and movies portray people with disabilities at all. But if the media are going to portray a person with a developmental disability, how about a realistic portrayal?

For example, a few years ago, a tear-jerking film called *The Other Sister* starred Juliette Lewis as a wealthy girl with a developmental disability who is extremely high-functioning and who wants to gain independence from her overprotective, though strangely uninvolved, mother. Lewis's character comes home from private, residential school and meets an extremely high-functioning boy who is taking college courses (he does need help to pass his classes). They fall in love, experience the joys of sex and eventually achieve their independence, marriage and a happy ending for all, including Mom. Sweet? Yes. Entertaining? Yes. But so is *Peter Pan*. Real? About as real as Peter's adventures in Never-Never Land.

How many people really understood the satire in *Forrest Gump*? How many just focused on Tom Hanks' sweet face, as he innocently blunders through the latter part of the twentieth century, affecting us all only for the good?

The majority of the general public base their views of people with developmental disabilities upon what they see on TV and in the movies. Perhaps they have some firsthand knowledge of the kid down the block who gets on the minivan in the morning, or the older relative who tags along with his aged parents to family functions and is "a little slow." Such realistic experiences are important because with knowledge comes acceptance, appreciation and the ability to overcome old fears and misunderstandings. If you expect to see Juliette, Sean or Tom walking with an awkward gait, you won't learn anything. But if you have the courage to open the door a little into the lives of people with developmental disabilities—by all means, swing it open all the way.

Any Saturday afternoon, come down to the bowling alley and meet my son and his friends. You won't meet Rainman, but you will meet real people grappling with autism and the social and emotional problems that come along with it. You won't meet Forrest, but you will meet young men who are graduating from school and hoping to find a job that will fulfil them. There are no girls in this group likely to have their own apartment or get married, as the "other sister" does. But there are girls—young women, really—who like boys on the team and enjoy music and dancing, and are struggling to express these feelings in an appropriate way.

> Does anyone in TV-land know that not all people with developmental disabilities look like Sean Penn, Tom Hanks or Dustin Hoffman, wearing their pants too short and dress shirts buttoned up to the neck?

You'll also meet real parents of children with developmental disabilities. The parents and their styles of parenting are varied, but there are no monsters or saints among us—though these are the two characteristics most often attributed to parents of children with disabilities in the movies. Rather, these

---

EP selects "parent editorials" for the purpose of providing a forum for emerging opinions and evolving parenting philosophies. EP also welcomes responses to previous editorials that represent divergent views. These select editorials do not necessarily reflect the opinion of EP. — Rick Rader, MD, Editor-in-Chief

Parents may send their submissions for Parent Perspective to Exceptional Parent Magazine, 65 E. Route 4, River Edge, NJ 07661; e-mail: epedit@aol.com. All submissions are subject to review and editing by EP.

"real" parents are, like all parents, worried about their children's future. But these parents are also worn down from the constant struggles with schools and with their children's social isolation. They are sometimes frustrated, sometimes even confused, depressed or angry, but they are always ready with a helping hand and a laugh. You have to have a wicked sense of humor to get through this life.

Does anyone in TV-land know that not all people with developmental disabilities look like Sean Penn, Tom Hanks or Dustin Hoffman, wearing their pants too short and dress shirts buttoned up to the neck? My son and all his friends are outright fashion plates, wearing the latest style, their favorite sports teams' logos and the hippest sneakers and hairstyles. They want to look good, and we make sure they do. God knows they stand out from the crowd enough without walking around dressed like Howdy Doody!

It's time for TV and the movies to portray real and ordinary people with developmental disabilities. Even today, when a national talk show features someone with developmental disabilities, it's a very high-functioning, attractive, pixyish person. I guess we should be grateful for any exposure at all, but I'm still waiting for a talk-show host to interview someone like my son and his friends. These young adults with mental retardation may not be so "cute" anymore. They may not have a perfect smile or they may have missed half their faces when they shaved, but they have triumphed by shaving at all!

Come on, Hollywood! Anyone want to come and make a movie about us? We've got it all: drama, suspense, triumph, tragedy and, believe it or not, lots of laughs. Is there anyone in the media courageous enough to tell the real story of your average, run-of-the-mill individuals with developmental disabilities and their families?

Show a story about real heroes: the parents who get up every morning and do all the things that you could never imagine you would still have to do for your adult child, before you were thrust into the different, parallel universe of the family with "special needs." Show us as neither saints nor sinners, but as real parents who love their children. Show our children as three-dimensional human beings, who grow up to be adults who do not look like Sean, Juliette or Tom in bad wardrobes.

There are great love stories buried in here, Hollywood! Real love stories. Take the time and courage to find them. And hey, it's okay if Julia Roberts wants to play me. EP

Roseann Forziano is the community educator for the Epilepsy Foundation of Long Island and a columnist for a local newspaper. Her 18-year-old son, Paul, has developmental disabilities.

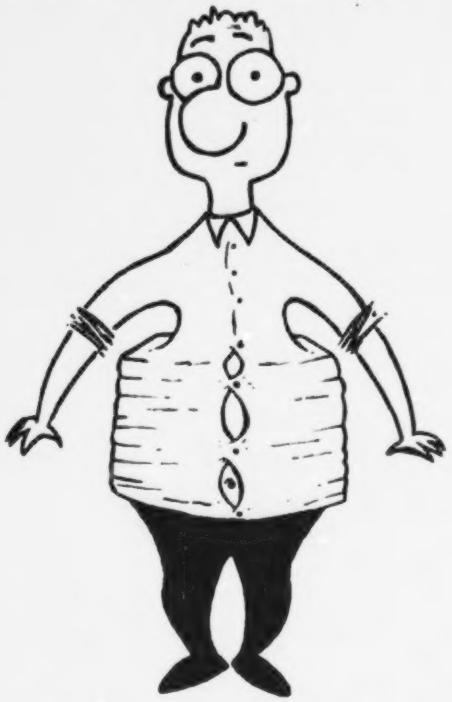
As our volunteer clearly demonstrates, 21* pediatric medical journals can be quite difficult to digest.



In fact, unless you have a medical degree we wouldn't recommend it.

If you have an interest in the latest breakthroughs and research published in pediatric journals, but don't have the medical training required to easily digest the information, there is an alternative.

ChildHealthMonitor.org publishes articles adapted from the latest monthly issue of each of the world's leading pediatric publications*. The information is the same. The difference is that much of the medical jargon is replaced with everyday language. It's also online which means that anyone with an Internet connection can now have instant access to reliable, useful information on the latest advances in treatment, prevention, and caring for kids.

Simply, visit **www.childhealthmonitor.org** and you too can have unlimited access to hundreds of simply written articles on up-to-the-minute pediatric discoveries.

We think you'll find this option much more palatable. (Our volunteer did.)

organizational spotlight

National Disability Sports Alliance

Sports For All

For more than 25 years, the National Disability Sports Alliance (NDSA) has been providing individuals with physical disabilities opportunities to participate in competitive sports, as well as recreation and fitness activities. Historically, the NDSA's primary focus has been on serving individuals with cerebral palsy and survivors of brain injury and stroke. Originally incorporated as the United States Cerebral Palsy Athletic Association, the name was changed in 2001 to reflect the growing number of disability groups represented. The new name also reflects NDSA's mission of providing a national structure for competitive sports among those with a wide range of physically disabling conditions, including muscular dystrophy and multiple sclerosis. Several sports are open to anyone with a diagnosed physical disability.

The organization's motto, "Sports For All," is promoted through numerous programs that allow an athlete, regardless of functional ability, to train and engage in highly competitive sports. To this end, NDSA has established a multilevel competitive system for both wheelchair users and individuals who are ambulatory. Once an appropriate level is determined, the athlete may choose from individual sports—competing against others at the same level—and team sports. This assures the most equitable form of competition. NDSA also has a strong competitive program for youth that uses age groupings in the following sports: bocce, bowling, cycling, equestrian, indoor wheelchair soccer, swimming, soccer and track and field.

The competitive events offered through NDSA have been organized with careful criteria to maximize the true sports nature of the competitions involving individuals with physical disabilities. NDSA holds clinics throughout the US where individuals who wish to serve as competition officials must demonstrate their abilities.

Along with six other national disability sports organizations, NDSA is a Community Based Organization (CBO) member of the United States Olympic Committee, joins such national groups as the YMCA, Jewish Community Centers, the Boys and Girls Club and similar orga-

nizations to form the CBO Council.

Since 1978, athletes from NDSA have represented the US in such international competitions as the 1984 International Games for the Disabled and the '88, '92, '96, and 2000 Summer Paralympic Games. NDSA athletes hold numerous world records in cycling, swimming and track and field. NDSA will host the 2005 World Games for Athletes with Cerebral Palsy, a major international event that will bring more than one thousand athletes from 60 countries to the United States.

The NDSA board of directors has begun an aggressive national marketing campaign to reach out to any and all individuals who could benefit from participation in sports, recreation and fitness activities and increase athletic membership, especially among youth. The NDSA firmly believes in the importance of youngsters with disabilities capitalizing on their abilities and potential athletic success.

In 2001, the US Olympic Committee created a new division, the US Paralympics, to manage elite paralympic sport in the US. NDSA has now refocused its efforts to grassroots and youth programs and is even more committed to reaching out to the hundreds of thousands of American youth with physical disabilities who could benefit from participation. Plans are under way to create affiliate programs throughout the country.

NDSA sanctions numerous local and regional events which lead to participation at the national level. The organization's "showcase" annual event is the National Sports Festival For The Disabled. This event serves as the national championships in seven of NDSA's sports. In 2000 the event also hosted the selection trials for the US Paralympic Track and Field Team. The 2002 event will include the Junior Nationals for Wheelchair Sports USA, as well as NDSA's junior and adult championships. The Festival will take place June 24-July 1 in New London, Connecticut. (See *What's Happening* for more details.)

After a quarter of a century, the National Disability Sports Alliance is still working to ensure that there will always be "Sports For All." EP

PART XI

Orthodontic Care for The Person With Special Needs:

AN OVERVIEW

By Michael B. Koidin, DDS, MScD

At first consideration, orthodontic care for the child or adolescent with special needs may appear to be superfluous in light of all the other parameters governing such an individual's daily existence. After all, daily lifestyle maintenance issues such as feeding, dressing and mobility should take precedence over the seemingly superficial importance of having "straight teeth." However, if one looks beyond the vanity factor fostered by our society's valuation of the beautiful smile, the importance of overall orthodontic health for the special needs population becomes apparent.

The incidence of malocclusion (unaligned or "bad" bite) in people with developmental disabilities is markedly higher than in the rest of the population, as has been shown in several studies done in Europe and the United States. This increased frequency of orthodontic problems is certainly multifactorial, ranging from inherent growth and development anomalies common to many syndromes, such as cross-bites in people with Down syndrome, to malocclusions. These may develop as a result of dental neglect and lack of professional supervision; for example, premature loss of primary (baby) teeth can lead to drifting and crowding of permanent teeth. Therefore, an orthodontic examination and assessment should be considered an integral aspect of dental care for every person with special needs.

Early orthodontic care, often termed preventive or interceptive treatment, is generally intended to avoid and/or minimize potentially harmful patterns. Such an approach of early intervention is particularly important for a person with a developmental disability who may not be able to tolerate braces or similar traditional orthodontic treatment. An important aspect of preventive orthodontics includes good restorative care of both primary and permanent teeth since space loss, crowding and even tooth impaction can result from dental decay and its consequences.

Another aspect of interceptive orthodontics is the timely removal of primary teeth so that they do not block or deflect the underlying permanent teeth from their proper eruptive paths. When these baby teeth are over-retained—when they are not shed on schedule—the result can be harmful cross-bite positions or impactions, which can become difficult orthodontic therapeutic challenges in a person with special needs.

Correction of functional asymmetries by early treatment intervention is also important to the orthodontic health of people with special needs. The promotion of symmetrical jaw growth in the young child is often essential in minimizing future orthodontic problems. Treatment may range from selected extractions of either primary or permanent teeth to rather complex orthodontic/orthopedic appliances designed to stimulate and/or favorably redirect bone growth. In many cases, especially with people exhibiting dentofacial anomalies (see the December 2001 and February 2002 issues of EXCEPTIONAL PARENT for descriptions), a team approach is used, with disciplines ranging from plastic surgery to oral surgery to orthodontics involved in the overall treatment. Therapy may be staged over many years; for example, corrective treatment for people with cleft lip/cleft palate may begin shortly after birth and can often continue into early adulthood.

As a dual-trained pediatric dentist and orthodontist, it has been my basic philosophy to offer all aspects of treatment—from preventive to restorative to orthodontic treatment—to everyone I see in my practice. It is our office's goal to provide every person with optimal dental health, functionally and cosmetically, irrespective of any disability. However, this philosophical idealism must be tempered with certain realities, as I have learned over the past twenty-four years. Nowhere else do these realities make themselves more apparent than in the orthodontic realm.

The decision to initiate orthodontic therapy on a person with special needs is based on the same parameters as it would be for any other person. Severity of the malocclusion, tooth eruption patterns, oral hygiene level, periodontal (gum tissue) status, decay activity and functional and esthetic issues are all considered before beginning active treatment. The issues of cooperation and risk/benefit, however, may take precedence in the decision-making process.

People with mild to moderate disabilities may often prove to be quite cooperative and compliant with the requirements of fixed orthodontic appliance therapy. Parental assistance with some aspects of treatment, such as headgear wear, expansion appliance adjustments and elastic wear, can be of great benefit in creating a successful therapeutic outcome. Of prime importance is the need to educate parents and direct support professionals (DSPs) about the necessity of maintaining good oral hygiene throughout the orthodontic process and how to accomplish that goal. This increased awareness about dental issues helps to avoid periodontal flare-ups and decay activity, which could interfere with treatment. Making parents and DSPs active participants in the therapy regimen provides another line of defense against the pitfalls of cooperation that seem to plague every orthodontic practice. Ironically, a good attitude on the part of parents and DSPs can make orthodontic treatment easier for a person with special needs than comparable therapy for a child without any special needs.

Practical considerations of cooperation, oral hygiene levels and safety must all be evaluated and explained to the parents and DSPs, who often have unrealistic expectations of what can be accomplished.

More severe disabilities, whether emotional, mental or physical, may preclude the use of traditional fixed orthodontic appliances. Practical considerations of cooperation, oral hygiene levels and safety must all be evaluated and explained to the parents and DSPs, who often have unrealistic expectations of what can be accomplished. Other treatment plans—whether in the form of an abbreviated, simplified course of therapy, or in the timely removal of primary or permanent teeth in order to alleviate crowding—may need to be presented and discussed. Risk/benefit is the concept that should be kept in the forefront when considering orthodontics for people with more severe special needs. Regardless, every person with developmental disabilities should be considered individually and given care, if at all possible. With patience and understanding, surprising and gratifying treatment victories may be achieved!

When all is said and done, orthodontic treatment is an elective procedure in the majority of cases, regardless of its functional and esthetic benefits. As applied to the population of people with special needs, orthodontics may be considered super-elective, especially for people with more severe disabilities. The overall needs of each individual person should be evaluated. If approached in this light, orthodontic therapy for the person with special needs can be highly rewarding for the orthodontist, parents, family members, DSPs and the person receiving the therapy.

Michael B. Koidin, DDS, MScD, is Assistant Clinical Professor of Pediatric Dentistry at The Boston University School of Dental Medicine. Dr. Koidin is trained in both pediatric dentistry and orthodontics and is in private practice in Lynn, MA.

PARENTING

THE ANGRY CHILD
Regaining Control When Your Child is Out of Control
TIM MURPHY, PH.D.

Anger can be a normal response to frustration or disappointment, but for some children it is an ingrained behavior that caused them and those around them needless misery. This book provides both the roots and the solutions for uncontrollable anger in children. Learn the 10 characteristics of the angry child; Four stages of anger and how to cope; the 5 C's of successful parenting and much more.

RW676XPA $24.00

FATHER NEED NEW!
Why Father Care Is as Essential as Mother Care for Your Child
KYLE D. PRUETT, M.D.

An easy to follow handbook which offers in depth advice for parenting children of all age groups from infancy through adolescence and adulthood. Learn not only why a father needs to take an active role in raising children, but also how to do so effectively.

RH237XPA 13.95

SPECIAL KIDS NEED SPECIAL PARENTS
A Resource for Parents of Children with Special Needs
JUDITH LOSEFF LAVIN NEW!

Parents of children with special needs face unique emotional and practical challenges every day. These issues are seldom fully addressed by the medical community—an parents' most compelling questions remain unanswered. The author draws upon interviews with health care professionals, nationally recognized authorities and families of special need children to give readers the advice, encouragement and comfort they crave.

GP6622PA $13.95

THE PARENT TO PARENT HANDBOOK
Connecting Families of Children with Special Needs
BETSY SANTELLI, FLORENE STEWARD POYADUE, JANE LEORA YOUNG

As a parent you have lots of questions. If you child has a disability you probably have even more. One of the best ways to find answers to your questions is through "Parent to Parent Programs". Written by two mothers that have been there this book will explain how these valuable programs work and how they can give you the help you need.

PB4979GN $29.95

ASPERGER SYNDROME

BLUE BOTTLE MYSTERY
KATHY HOOPMANN

A warm, funfilled fantasy story that enables children with Asperger syndrome to read about their disability in a non threatening way that promotes the best in them.

TF9785 NEW! $11.95

ASPERGER SYNDROME, THE UNIVERSE, AND EVERYTHING
KENNETH HALL

The author was diagnosed with Asperger Syndrome at age eight, and now he describes some of the inner experiences and perceptions a child with autism has from a unique perspective that only one who has been through it can truly explain.

TF9300AS $11.95

OF MICE AND ALIENS
An Asperger Adventure
KATHY HOOPMANN

Ben, recently diagnosed with Asperger Syndrome, and his friend Andy uncover an alien spaceship that crash landed in their backyard. With Ben trying to cope with his disorder, and the alien trying to cope with life on earth, adventure ensues.

TF007XAS $11.95

FOR YOUNG PEOPLE

BEN KING OF THE RIVER
DAVID GIFALDI WITH ILLUSTRATIONS BY LAYNE JOHNSON

The touching story of Ben, a young child with a developmental disability, and his brother who encounter some different and exciting situations and people on a family camping trip.

BABY ON THE WAY
WILLIAM SEARS, MD, MARTHA SEARS, RN, AND CHRISTIE WATTS KELLY WITH ILLUSTRATIONS BY RENEE ANDRIANI

When a family is expecting a new baby there are many changes that take place. This warm insightful book helps children and their parents joyously and lovingly prepare for the newest member of the family.

TW767YP NEW! $12.95

WHAT BABY NEEDS
WILLIAM SEARS, MD, MARTHA SEARS, RN, AND CHRISTIE WATTS KELLY WITH ILLUSTRATIONS BY RENEE ANDRIANI

When a family brings a new baby home there are many changes. This children's book clearly explains baby's needs while emphasizing how siblings can be helpers to both baby and parents, while forging their own relationships with "the baby".

TW8287YP NEW! $12.95

EPILEPSY

THE KETONGENIC DIET
A Treatment for Epilepsy
JOHN M. FREEMAN, MD, JENNIFER B. FREEMAN, MILLICENT T. KELLY, RD, LD

Devoted exclusively to explaining a unique doctor approved approach to minimizing seizures, this book is a must have for all families affected by epilepsy and seizures. The diet presented within is high in fat and low in carbohydrates and protein, helping to control seizures and allow children to lead normal seizure and drug free lives.

DE9390EP $24.95

YOUR CHILD AND EPILEPSY
Robert J. Gumnit, M.D.

This book is designed to help both patients and healthcare professionals to understand all aspects of diagnosis, and of pharmacological and surgical management. It will help parents and older children with epilepsy to participate more knowledgeably with their health care providers.

DE7760EP $24.95

SEIZURES AND EPILEPSY IN CHILDHOOD
A Guide for Parents
JOHN M. FREEMAN, M.D.

This Second Edition in addition to providing up to date information about new diagnostic techniques, drugs, diet and surgical treatments; includes a new chapter addressing the special needs children with epilepsy have regarding routine health care.

JH4989EP $17.95

HEALTHCARE

ASK A NURSE
From Home Remedies to Hospital Care
AMERICAN ASSOCIATION OF COLLEGES OF NURSING
EDITED BY: GERALDINE BEDNASH, PH.D., R.N., FAAN

This book provides comprehensive information on standard treatments, home remedies, and effective over-the-counter medications for health problems ranging from allergies to yeast infections. With the expertise of 550 nursing schools and personal advice from 100 registered nurses nationwide, you can learn what to do whey your or a family member is sick and in need of care. Chapters are arranged alphabetically so it is easy to find what you need.

SS6875CN $30.00

TRANSCULTURAL ASPECTS OF PERINATAL HEALTH CARE
A Resource Guide
NATIONAL PERINATAL ASSOCIATION

This book, revised in March 2002, offers resources and information supporting requirements of the Office of Civil Rights, the Maternal and Child Health Bureau of HRSA, and JCAHO in Cultural Sensitivity, Cultural Competency, Core Health Status Indicators, Developmental Health Status Indicators, Interpreter Competency and Patient Education. A great source for Title V Applications. User Friendly chapters, fourteen (14) so far, include narrative and support sections. Easy to include updates as they become available.

EP8020PN $79.00
EP8021PN (March, 2002 Update) $19.95

PHYSICAL DISABILITY

TORTICOLLIS
Differential Diagnosis, Assessment and Treatment, Surgical Management and Bracing
KAREN KARMEL-ROSS, PT, PCS, LMT

Clearly reflects the philosophy of the team approach by including contributions from a pediatric orthopedist, pediatric general surgeons and several pediatric physical therapists. Reviews the differential diagnosis and surgical management of CMT and provides a detailed, comprehensive approach to the nonoperative management of CMT by bringing together a wide range of related materials under one cover.

TRANSITIONING

Gynecological and Reproductive Healthcare for Women with Special Needs

By Catharine A. Kopac, PhD, GNP

Over the past decade I have collaborated with Joni Fritz, former director of the American Network of Community Options and Resources (ANCOR), in researching the gynecological and reproductive healthcare of adolescent and adult women with developmental disabilities. My own education as a gerontological nurse practitioner, coupled with Joni's experience in the field, has enabled me to begin to build a bridge of understanding to the challenges that adolescents and women with special needs encounter when seeking healthcare. I rely on Joni's insight as I struggle to interpret the data and reach conclusions. Our early work demonstrated that frequently, a central figure in the provision of gynecological and reproductive (gyn/rep) care for adolescent and adult women with special needs is the professional nurse. In addition, the early work raised many questions and left us unsatisfied with the quality and bias of our data. Consequently, we decided to query nurses who work in the field of women's health about their perceptions of the adequacy of gyn/rep care for women with developmental disabilities. This article will review some of the central findings of a survey of 727 professional nurses—representing four professional nursing organizations—from across the United States.

Introduction and Historical Perspective

Over the past several decades, care for persons with developmental disabilities has moved from the institutional setting to the community; at present most of these people live in community settings. As a result, the need for community-based healthcare services that target persons with developmental disabilities has been recognized and new roles have emerged. As changes have occurred in the overall healthcare system, persons with developmental disabilities have had to adapt to managed care; considered a challenge for the average consumer, working with managed care entities may often exceed the capabilities of a person with special needs. Despite the Americans with Disabilities Act of 1990, the present healthcare system often fails to accommodate the needs of persons with developmental disabilities because healthcare professionals are poorly educated and poorly prepared to offer services for persons with special needs. Additionally, the scope of the need for gynecological and reproductive care for adolescent and adult women with special needs remains outside the purview of the average healthcare administrator. While acknowledging that the person with a disability cannot be discriminated against, the administrator knows that the number of persons with special needs who seek care is small and therefore not a priority. And finally, there is an underlying perception about the basic needs of persons with cognitive challenges. Sulpizi reported that "the reproductive needs of women with developmental disabilities are often overlooked in the delivery of healthcare because these women are regarded as somehow asexual."

In what is perhaps the only reported long-term study of healthcare utilization for people with developmental disabilities, Rowitz and Farber described a 25-year follow-up study of families with a member who is severely handicapped. They found that the most frequently used healthcare professionals were general practitioners, pediatricians, dentists and neurologists, while those most infrequently used included gynecologists, cardiologists, orthodontists, oral surgeons, plastic surgeons and chiropractors. Thus, there clearly is a need to study the gynecological and reproductive care available to adolescent and adult women with developmental disabilities.

The Survey

The purpose of the survey was to examine the accessibility and availability of gynecological and reproductive services from the perspective of professional nurses. A questionnaire was mailed to 3451 potential respondents who were members of four different professional nursing organizations:

- American College of Nurse Midwives (a random selection of 14.2 percent of the membership)
- Association of Women's Health, Obstetric and Neonatal Nurses (a random selection of 27.1 percent of the membership who list their specialty as women's health)
- American Association on Mental Retardation (entire membership of the Nursing Division)
- Developmental Disabilities Nurses Association (entire membership)

The 727 nurses responding to the mailing had an average age of 46.3 years. Nearly half had a master's degree or higher. Although highly educated, a large percentage of the respondents (634 = 88.5 percent) reported that their basic nursing education did not include curricula on clinical approaches and treatment of adolescent and adult women with developmental disabilities. Moreover, almost 70 percent reported that they had no continuing education about developmental disabilities. These numbers

* This article is based on a study that was funded in part by Tau Chapter, Sigma Theta Tau International and the American Network of Community Options and Resources (ANCOR).

are alarming—nurses are not receiving basic education in the care of persons with special needs. Nor are a large number of them taking advantage, or even aware, of educational opportunities offered by the Developmental Disabilities Nurses Association (DDNA) or the American Association on Mental Retardation (AAMR), Nursing Division. This is particularly troubling because more than half of the nurses in the sample further reported that there was no one in their clinical setting with special training in working with adolescent or adult women with special needs.

Table One

The Availability of STD/HIV Services

Rated by Professional Nurses

TYPE OF SERVICE	RATING OF SERVICE [NO. (%)]			
	All/Many*	Some*	None	N/A**
STD Screening	229 (45.0)	137 (26.9)	117 (23.0)	25 (4.9)
Counseling/Rx STD	194 (38.9)	117 (23.3)	163 (31.9)	27 (5.3)
HIV Testing	163 (32.3)	103 (20.4)	208 (41.2)	30 (5.9)
Counseling/Rx HIV	166 (32.8)	103 (20.4)	208 (41.2)	30 (5.9)

*The category of "All/Many" is a combination of separate categories of "All" and "Many"; the category of "Some" is a combination of separate categories of "Some" and "Few." The combinations were made to provide for the interpretation of the data.

**The category of N/A (Not Applicable) enabled the respondents to identify if the particular service being rated was not applicable to their respective clinical setting.

There were 727 completed surveys in the study; for the listed services, not all respondents rated every service, consequently the horizontal totals do not equal 727.

STD=sexually transmitted disease; HIV=human immunodeficiency virus; Rx=treatment

Services Provided

Only 48.1 percent of the responding nurses reported that health education was available to "all or many" of the women in their clinical settings. This indicates that the majority of clinical agencies these nurses represent do not routinely provide health education to this population. With its major care focus on empowerment of people to become more independent and to assume responsibility for caring for themselves, that nurses find this aspect of healthcare delivery so lacking is difficult to believe. In a previously reported study, Kopac and colleagues found that women with developmental disabilities were expressing the desire to have more health education.

Another surprising finding was that so many of the clinical agencies for which the respondents worked did not provide counseling and/or treatments for STDs or HIV infections, and many clinical settings did not even provide STD screening and HIV testing (see Table One). The low level of STD-related services raises concern because AIDS is now spreading among people with developmental disabilities. Unfortunately, many professionals have the mistaken belief that people with disabilities are asexual. When the assumption of asexuality is coupled with the challenge of providing healthcare education on STDs to people with developmental disabilities and cognitive challenges, the results are often less than satisfactory. The low level of STD services and the apparently low use of health education services lead one to believe that protection against the spread of HIV infections and other STDs may be alarmingly inadequate.

Barriers to Care

The majority of the nurses (81.4 percent) reported that they encountered barriers to providing adequate care. The two cited most frequently were a lack of empathy and/or knowledge on the part of the healthcare provider, and difficulty finding primary care providers who were willing to care for women with developmental disabilities. This finding supports the need to promote education of healthcare professionals in the provision of gynecological and reproductive services to adolescent and adult women with developmental disabilities. Difficulty finding providers may also be related to financial concerns, because many providers choose not to treat persons insured through Medicare or Medicaid. Fifty-eight of the nurses reported that insurance would not cover the service required or the time needed to do an exam or other procedures.

These barriers are further compounded by the women's fear of examinations, and by communication difficulties between the women and their providers. The women's fear caused concern for a number of the nurses because it also related to the adolescent or adult woman's ability to give consent. Other listed barriers included assumptions that the woman is not sexually active, inaccessible offices or inappropriate equipment and provider fear or impatience. These barriers could largely be forestalled through education of healthcare professionals. For those professionals already in practice, continuing education programs and internships are needed.

Physical and Sexual Abuse

More than 45 percent of the responding nurses reported that they had identified physical abuse of women with developmental disabilities. In a related item, nearly half the responding nurses reported that they had identified cases of sexual abuse, while an almost equal number of nurses (335 = 46.0 percent) did not respond to the request for the type of assistance that they give these women (see Table Two). It is troubling that nearly half of the 727 responding nurses chose not to answer the questions on abuse, since nurses have such strong advocacy roles in both clinical and community healthcare settings. Sexual abuse is suspected to be underreported in persons with developmental disabilities. In an earlier study, Kopac and colleagues found that a number of agencies that serve women with developmental disabilities do not recognize the need to identify and intervene with women who

continued on page 108

continued from page 107

have experienced sexual abuse.

Table Two

Type of Assistance Given to Adolescent and Adult Women

WHO HAVE EXPERIENCED SEXUAL ABUSE	
No Response	335 (46.0%)
Referral for Counseling	79 (10.8%)
Referral to Agencies	69 (9.4%)
Provide support, careful teaching & education	49 (6.7%)
Counsel re: safety, reporting & use of shelters	48 (6.6%)
Counsel, test & prescribe for STDs	45 (6.1%)
Referral to social services	38 (5.2%)
No incidents, not necessary, too old	36 (4.9%)

Ethical Concerns

The response of the nurses to a question on ethical concerns reflected the strong advocacy role that nurses play. When listing their concerns, they first and foremost identified inadequate services, which they saw as being related to a lack of funding for these services (see Table Three). This was followed by a number of issues related to sexuality and contraception and multiple issues involving informed consent. Some of the nurses wrote passionately about the challenges of securing adequate care for the women they serve and often questioned the judiciousness of sedating patients or using anesthesia to accomplish exams when the women do not understand what is being done to them.

Table Three

Ethical Concerns Identified by Nurses

WHO HAVE EXPERIENCED SEXUAL ABUSE	
No Response	255 (35.0%)
Inadequate service/funding	116 (15.9%)
Sexuality/contraception	112 (15.4%)
Informed consent	90 (12.3%)
Right to treatment	46 (6.3%)
Child bearing, child rearing, right of persons with special needs to bear/raise children	39 (5.3%)
"Force" exams on unwilling	36 (4.9%)

Summary

When I began the nurse study with my collaborator, I hoped my findings from the earlier study would be refuted. Unfortunately, this is not the case. This second study confirms what the earlier study showed and, because of the sample size and the sophistication of the respondents, confirms the need to focus attention on the data. This study clearly documented several findings that demand immediate attention:

- There are too few primary care providers delivering gynecological and reproductive services to adolescent and adult women with special needs.
- Preparation of healthcare providers is inadequate to provide comprehensive, individualized gynecological and reproductive care for adult and adolescent women with special needs.
- Preparation of professional nurses for the gynecological and reproductive care of adolescent and adult women with special needs is inadequate in both basic and continuing nursing education.
- There is a lack of recognition within the healthcare system of the need to identify and intervene in cases of physical and sexual abuse of adolescent women with special needs.
- STD/HIV screening, testing and treatment are not recognized as important aspects of care for adolescent and adult women with special needs.

I hope these findings will be used to support the enhancement of education efforts for healthcare professionals who serve adolescents and adult women with special needs. Further, it is time that the healthcare system, with its managed care focus, take a hard look at the provision of gynecological and reproductive services for adolescents and women with special needs. As a nurse ethicist, I believe that the time has come to incorporate all vulnerable populations into the nation's healthcare education, planning and programs. EP

Catharine A. Kopac is currently a primary care fellow in the Center for Clinical Bioethics at the Georgetown University Medical Center in Washington, DC. At present she has a research and practice interest in three vulnerable populations: persons with Alzheimer's disease, older adults requiring long-term care and women with developmental disabilities.

This material was excerpted from Kopac, C and Fritz, J (2002). The Availability and Accessibility of Gynecological Services for Women with Developmental Disabilities: A Nursing Perspective, an article submitted to the Journal of Women's Health and Gender Based Medicine.

LOOK FOR THIS SYMBOL IT'S YOUR GUARANTEE OF QUALITY

It means your adaptive equipment dealer is a member of NMEDA—the National Mobility Equipment Dealers Association—and that your dealer makes a special effort to assure customer Safety, Comfort, and Convenience!

- NMEDA dealers are factory-trained professionals
- NMEDA dealers use only proper tools and high quality materials and follow recommended practices, because the safety welfare of their customers—and everyone on the road—is their first priority.
- A NMEDA customer knows the work on his or her vehicle has been professionally completed by a dedicated, caring and responsible dealer worthy of their trust.

Call our toll-free National Hotline for the location of the NMEDA dealer nearest you:

Anderson School

Building A Tradition of Service for Over 78 Years

Anderson School provides the highest quality programs possible for children (ages 5-21) and adults with autism and other developmental disabilities. Anderson School is an educational residential community committed to an ongoing and fully integrated support network for their families and guardians. As an organization, Anderson School constantly strives to provide an enriched and positive climate filled with educational, cultural and recreational activities designed to foster continuous growth, independence and social interaction.

Located near historic Hyde Park (approximately 95 miles from midtown Manhattan) on a scenic 100 acre wooded estate overlooking the Hudson River, Anderson School serves all of New York State and welcomes out of state applications.

JELLY BEAN® BOOSTER SWITCH

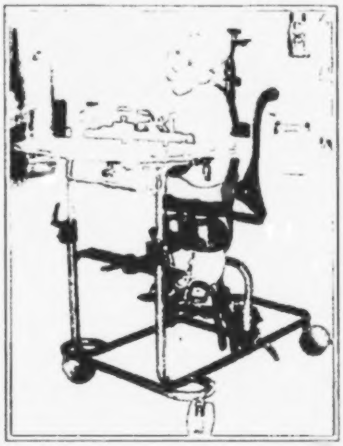
The Jelly Bean Booster Switch has an angled base for easy access and provides audible feedback with each press. It comes with an AbleLink Connectables® base and Snap Track connector. The Connectables base allows the switch to be easily detached and reattached from mounted or non-mounted locations. The Snap Track connector allows multiple Jelly Bean Booster Switches to link together, creating a customized system. The Jelly Bean Booster Switch is available with red, pink, yellow, green, blue, purple and black activation areas.

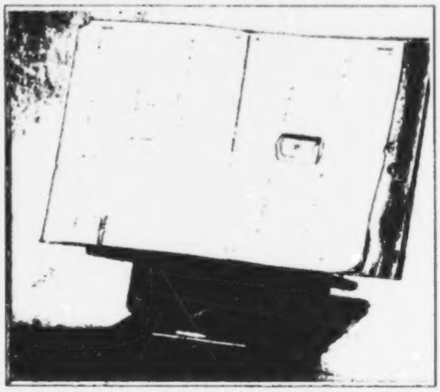
AbleNet, 1081 Tenth Avenue SE, Minneapolis, MN 55414-1312; Phone: (800) 322-0956, (612) 379-0956; (612) 397-9143; Web site: http://www.ablenetinc.com; E-mail: customerservice@ablenetinc.com

EASYSTAND® MAGICIAN EI®

The EasyStand Magician EI is a fully adjustable standing aid that can be comfortably positioned anywhere between sitting and standing. It provides a wrap-around seat and back support that conform to the child. The Magician EI also comes with side supports, knee supports, foot holders with foot straps, seat belt, clear acrylic tray and four locking casters. This standing aid has a tubular frame, a back angle indicator that allows for precise positioning, and an ultra-low shear lifting mechanism that mimics natural body movement.

Altimate Medical, PO Box 180, 262 West 1st Street, Morton, MN 56270; Phone: (800) 342-8968, (507) 697-6393; Fax: (877) 342-8986, (507) 697-6900; Web site: http://www.easystand.com; E-mail: info@easystand.com





ATLAS™ ULTRA

The Atlas Ultra is an ergonomically designed book and copy holder that provides an adjustable viewing height and angle for comfortable reading. Made of Trespa®, a strong wood product, this book holder comes with four page-stoppers to help keep the book open and an optional line guide to hold a place on the page. Color choices include raspberry, lemon, stone beige, sunflower and black.

FRACTILES-7

Fractiles-7 is a flexible magnetic tile toy with angles based on the number seven. These red, yellow and blue diamond-shaped tiles are easily manipulated to create patterns such as starbursts, butterflies and 3-D illusions. Fractiles-7 can be used as an aid in building pattern recognition, visual analysis and fine motor skills. These magnetic tiles are maneuvered on a sturdy black textured steel activity board. The tiles and board can be transported and stored in the record-jacket-style package.

FRACTILES, Inc., 2525 Arapahoe Ave., Suite E4-110, Boulder, CO 80302; Phone: (303) 541-0930; Fax: (303) 442-7776; Web site: http://www.fractiles.com; E-mail: fractiles@fractiles.com

What I Love About Sarah

by Bridget Kramer

Bridget Kramer, (r.) 11, and her sister, Sarah, 9, can often be found spending time together.

I'd like to tell you about someone who isn't like most people. In her own way, she's very special. Her name is Sarah and she is my little sister. She is 9 years old and she has mental retardation and cerebral palsy. She is always happy unless she's sick. She can't walk or talk but she has a way to communicate. Whenever she sucks her index and middle fingers on her left hand, that means she's hungry. Another way she isn't like other kids is that she loves to take a bath. She always gets excited when she's getting ready.

Sometimes my mom and dad are sad when she cries a lot. When this happens, I go in and sit with her. I don't think I've ever lived a day without thinking about her. She still has to wear a bib and diaper. She wears glasses, too. She drinks nutritional supplements every day. Banana and vanilla are her favorite flavors.

She can make the whole family laugh so hard, but she has never made me cry. It made my mom and dad cry when they found out that she was retarded. Sometimes I wish that she could be normal, but I know that I can't change it; that's when I love her most. All of my friends think she is really cute. It makes me feel happy when they say that. I know then that they're not scared of her. EP

MOM AND DAD'S TURN

Barbie Garrison and Paul Kramer are Bridget and Sarah's parents

"We recently attended a monthly meeting of our Special Parents group where we heard about 'chronic sorrow.' Bridget wanted to stay with us and hear the presentation rather than hang out with the other children. Many issues that surround having a child or sibling with special needs were discussed and Bridget was attentive to the various feelings described.

"We found that Sarah was special when Bridget was almost 3 years old. At the time, we explained Sarah's condition in a way that Bridget could understand. Her interpretation was, 'Sarah isn't growing up right. I grew up fast; Sarah is growing up slow.'

"When we returned home, we were reading our most recent issue of EP, and I told Bridget about the Children's Page. She immediately set to writing and produced the touching sentiments included here.

"Until this time, we weren't really sure how well Bridget understood her sister or how deep her feelings about Sarah were. We are grateful for this opportunity for Bridget to express her feelings. We are also happy that we have the blessing of two wonderful children."

Submit your Children's Page to: EP, ATTN: CHILDREN'S PAGE, 65 East Route 4, River Edge, NJ 07661. Be sure to include your name, address, daytime telephone number, and e-mail address! ***Now on the Web!*** We now include **Familiar Faces** and **Children's Page** on our Web site, http://www.eparent.com. Please send us your photographs with the understanding that doing so gives EP permission to put the photos on the EP Web site, exactly as they appear in the magazine and with the same text.

Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed —while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt.

Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

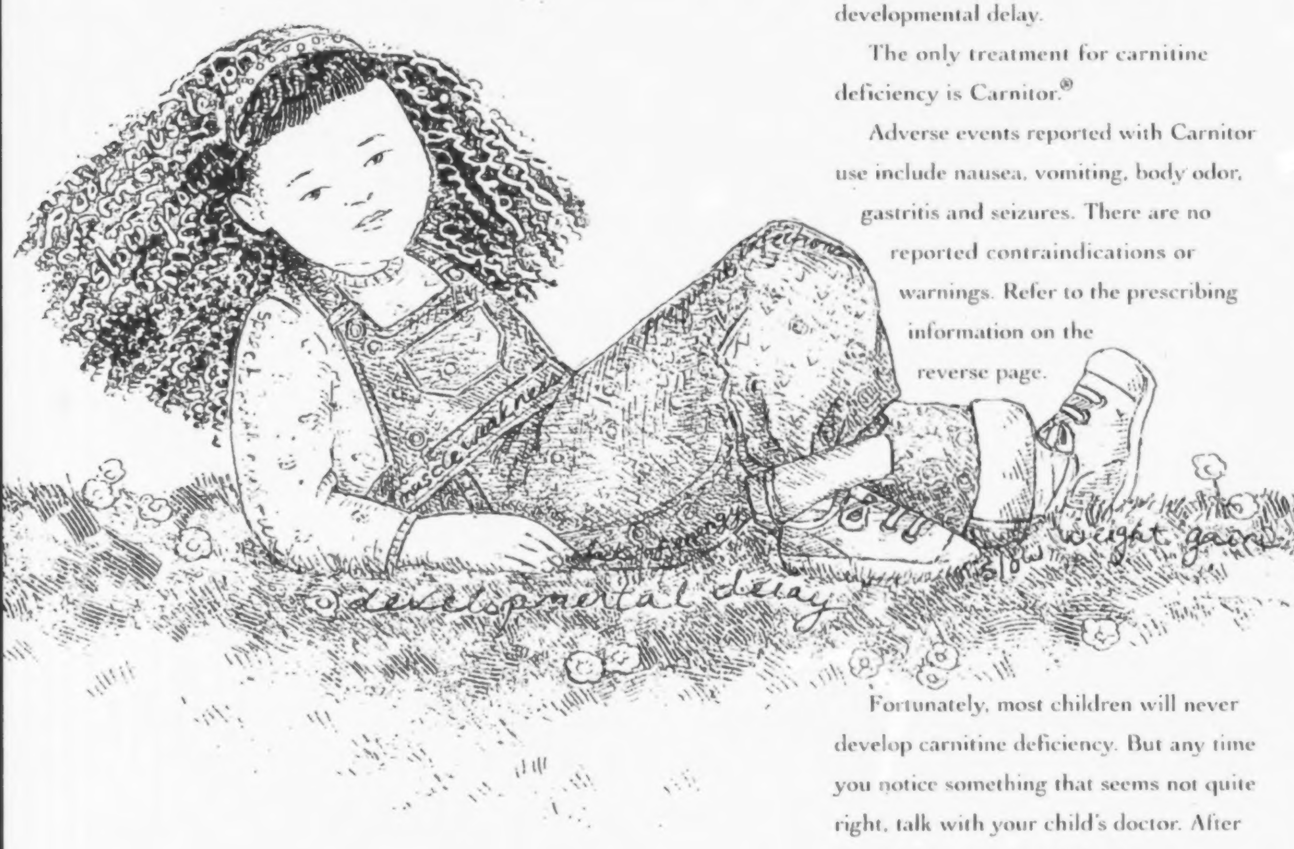
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 μmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

(5 PM CDT, 4 PM MDT and 3 PM PDT)

July 10, 2002 - 8 PM - 9 PM (EDT)
(7 PM CDT, 6 PM MDT and 5 PM PDT)

Featuring:

A. Leland Albright, MD

Professor of Neurosurgery, University of Pittsburgh School of Medicine; Chief, Department of Pediatric Neurosurgery, Children's Hospital of Pittsburgh.

Terence Edgar, MD

Associate Professor of Neurology & Pediatrics; Director of Neuromuscular & Movement Disorders Programs, Arkansas Children's Hospital.

Open to Families & Caregivers!

Learn how to differentiate between childhood movement disorders and associated symptoms. Additionally, the experts will discuss available treatment options, outcomes and resources for more information. Following the brief presentation, the experts will be available for questions on-line and via telephone hook-up.

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

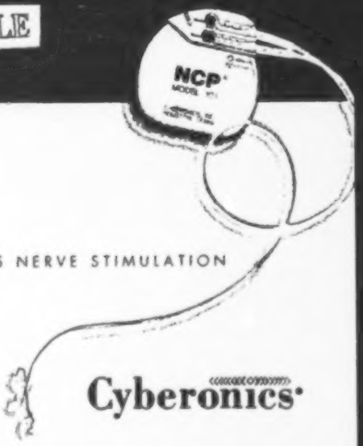
So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

BEST COPY AVAILABLE



VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

EXECUTIVE SUMMARY[1]
SAFETY INFORMATION
FOR THE NCP® SYSTEM

INTENDED USE / INDICATIONS – UNITED STATES

The NCP System is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications.

CONTRAINDICATIONS

- The NCP System cannot be used in patients after a bilateral or left cervical vagotomy.
- Do not use short-wave diathermy, microwave diathermy, or therapeutic ultrasound diathermy on patients implanted with the NCP System. Diagnostic ultrasound is not included in this contraindication.

WARNINGS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals. This is not intended to serve as a substitute for the complete NCP System Physician's Manual.

⚠ The **safety and efficacy** of the NCP System has not been established for uses not covered in the "Intended Use/ Indications" section of the manual.

⚠ The safety and efficacy of the NCP System treatment has not been established for stimulation of the **right vagus nerve** or of any other nerve, muscle, or tissue.

⚠ **Excessive stimulation** at a combination of high frequency (≥ 50 Hz) and an excess duty cycle (that is, one that occurs when ON time is greater than OFF time) has resulted in degenerative nerve damage in laboratory animals. An excess duty cycle can be produced by continuous or frequent magnet activation (> 8 hours), as determined by animal studies. Cyberonics recommends against stimulation at these combinations of ranges.

⚠ **Aspiration** may result from the increased swallowing difficulties reported by some patients during stimulation. Patients who have **pre-existing swallowing difficulties** are at greater risk for aspiration.

⚠ **Device malfunction** could cause painful stimulation or direct current stimulation. Either event could cause nerve damage and other associated problems. Patients should be instructed to use the magnet to stop stimulation if they suspect a malfunction, and then to contact their physician immediately for further evaluation. Prompt surgical intervention may be required if a malfunction occurs.

⚠ Susceptible patients with predisposed cardiac conduction systems (re-entry pathway) have not been studied as part of controlled clinical trials to establish the safety of NCP system treatment in these patients. Evaluation by a cardiologist is recommended if the family history, patient history, or electrocardiogram suggests an abnormal cardiac conduction pathway. Serum electrolytes, magnesium, and calcium should be documented before implantation. Post-implant electrocardiograms and Holter monitoring are recommended if clinically indicated.

⚠ **Sudden unexplained death in epilepsy (SUDEP):** Through August 1996, 10 sudden and unexplained deaths (definite, probable, and possible) were recorded among the 1,000 patients implanted and treated with the NCP device. During this period, these patients had accumulated 2,017 patient-years of exposure. Some of these deaths could represent seizure-related deaths in which the seizure was not observed, at night, for example. This number represents an incidence of 5.0 definite, probable, and possible SUDEP deaths per 1,000 patient-years. Although this rate exceeds that expected in a healthy (nonepileptic) population matched for age and sex, it is within the range of estimates for epilepsy patients not receiving vagus nerve stimulation, ranging from 1.3 SUDEP deaths for the general population of patients with epilepsy, to 3.5 (for definite and probable) for a recently studied antiepileptic drug (AED) clinical trial population similar to the NCP System clinical cohort, to 9.3 for patients with partial onset epilepsy.

⚠ **The NCP device is not curative:** Physicians should warn patients that the NCP System is not a cure for epilepsy and that since seizures may occur unexpectedly, patients should consult with a physician before engaging in un-supervised activities, such as driving, swimming, and bathing, and in strenuous sports that could harm them or others.

⚠ **Obstructive Sleep Apnea:** Patients with obstructive sleep apnea (OSA) may have increased apneic events during stimulation. Cyberonics recommends care when treating patients with preexisting OSA. Lowering stimulus frequency or prolonging OFF time may prevent exacerbation of OSA.

PRECAUTIONS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals.

⚠ **Laryngeal irritation** may result from stimulation. **Patients who smoke** may have an increased risk of laryngeal irritation.

⚠ **Dyspnea** may result from stimulation. **Patients with chronic obstructive pulmonary disease** may have an increased risk of dyspnea.

⚠ It is important to follow **recommended Implantation procedures and intraoperative product testing** described in this manual. During the intraoperative Lead Test, rare incidents of bradycardia and/or asystole have occurred. As of October 1998, approximately 3,000 patients had been implanted with the NCP System. Four of these patients were reported to have experienced **bradycardia and/or asystole** during the intraoperative Lead Test. All four patients recovered without sequelae. One of the four patients was implanted with the NCP System. There were no postoperative or VNS-treatment-related cardiac adverse events later reported for that patient. No similar events were reported to have occurred during the clinical studies at the time of implantation or during treatment. The safety of this therapy has not been systematically established for patients experiencing bradycardia or asystole during NCP System implantation.

⚠ **Reversal of lead polarity has been associated with an increased chance of bradycardia** in animal studies. It is important to make sure that the Lead connector pins are correctly inserted (white marker to + connection) into the Pulse Generator header.

⚠ It is important to follow **infection control procedures**. Infections related to any implanted device are difficult to treat and may require that the device be explanted. Cyberonics recommends that the patient be given antibiotics preoperatively. The surgeon should ensure that all instruments, including the NCP Tunneling Tool, are sterile prior to the operation.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve** in the neck area inside the carotid sheath.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve below where the superior and inferior cervical cardiac branches separate from the vagus nerve.**

⚠ **A neck brace** can be used by the patient for the first week to help ensure proper Bipolar Lead stabilization.

Environmental and Medical Therapy Hazards

⚠ Patients should exercise reasonable caution in avoiding devices that generate a **strong electric or magnetic field.** (For examples, see the "Other Environmental Hazards" section of the Physician's Manual.) If a Pulse Generator ceases operation while in the presence of electromagnetic interference (EMI), moving away from the source may allow it to return to its normal mode of operation.

⚠ NCP System operation **should always be checked** by performing device diagnostics after any of the procedures mentioned in the Physician's Manual.

⚠ Because of where the Pulse Generator is implanted in the chest, **patients may need to be specially positioned in mammography equipment for clear imaging.** Otherwise, the device may be seen as a shadow on the mammogram. (Most routine diagnostic procedures, such as fluoroscopy and x-radiography, are not expected to affect system operation.)

⚠ **Therapeutic radiation** may damage the Pulse Generator's circuitry, although no testing has been done to date and no definite information on radiation effects is available. Sources of such radiation include therapeutic x-rays, cobalt machines, and linear accelerators. The radiation effect is cumulative, with the total dosage determining the extent of damage. The effects of exposure to such radiation can range from a temporary disturbance to permanent damage, and may not be detectable immediately.

⚠ **External defibrillation** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for external defibrillation.

⚠ **Electrocautery surgery** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for electrocautery surgery.

⚠ **Magnetic resonance imaging** (MRI) should not be performed with a magnetic resonance body coil in the transmit mode. The heat induced in the Bipolar Lead by an MRI body scan can cause injury.

Use caution when other MRI systems are used, since adverse events may occur because o different magnetic field distributions.

⚠ No scan in which the radiofrequency (RF) is transmitted by the body coil should be done on a patient who has the NCP System. Thus, protocols must not be used which utilize local coils that are RF-receive only, with RF-transmit performed by the body coil. Note that some RF head coils are receive only, and that most other local coils, such as knee and spinal coils, are also RF-receive only. **These coils must not be used in patients with the NCP System.**

⚠ **Therapeutic ultrasound.** Routine therapeutic ultrasound could damage the Pulse Generator and may be inadvertently concentrated by the device, causing harm to the patient.

⚠ **Extracorporeal shockwave lithotripsy** may damage the Pulse Generator. If therapeutic ultrasound therapy is required, avoid positioning the Pulse Generator part of the body in the water bath or in any other position that would expose it to ultrasound therapy. If that positioning cannot be avoided, program the Pulse Generator output to 0 mA for the treatment, and then after therapy, reprogram the Pulse Generator to the original parameters.

Diagnostic ultrasound is not expected to affect the NCP System.

⚠ The Pulse Generator may affect the operation of **other implanted devices**, such as cardiac pacemakers and implantable defibrillators. Possible effects include sensing problems and inappropriate Pulse Generator responses. If the Pulse Generator patient requires concurrent implantable pacemaker and/or defibrillator therapy, careful programming of each system is necessary to optimize the patient's benefit from each device.

ADVERSE EVENTS

Adverse events reported during clinical studies as statistically significant are listed in alphabetical order Ataxia (muscle movements or twitching, generally associated with stimulation); Dyspepsia (indigestion); Dyspnea (difficulty breathing, shortness of breath); Hypesthesia (impaired sense of touch); Increased coughing; Infection; Insomnia (inability to sleep); Laryngismus (throat, larynx spasms); Nausea; Pain; Paresthesia (prickling of the skin); Pharyngitis (inflammation of the pharynx throat); Voice alteration (hoarseness);Vomiting.

Other potential adverse events possibly associated with surgery or stimulation include but are no limited to the following:

Aspiration (fluid in the lungs); Blood clotting; Choking sensation; Damage to nerves or vasculature i the surgical area, including the carotid artery and jugular vein; Device (Generator and/or Lead) migration or extrusion; Dizziness; Dysphagia (difficulty swallowing); Duodenal ulcer, gastric ulcer; Ear pain; Facial flushing; Facial paralysis, paresis; Foreign body reaction to implants, including possible tumor formation; Formation of fibrous tissue, pockets of fluid; Heart rate and rhythm changes; Hiccuping; Incision site pain; Irritability; Laryngeal irritation (sore, painful throat); Left hemidiaphragm paralysis; Left recurrent laryngeal nerve injury; Left vocal cord paralysis; Low-grade fever; Muscle pain; Neck pain; Nerve injury; Painful or irregular stimulation; Skin, tissue reaction; Stomach discomfort; Tinnitus (ringing in the ears); Tooth pain; Unusual scarring at the incision site; Urinary retention; Vagus nerve paralysis; Weight change; Worsening of asthma and bronchitis; Worsening of cardiac abnormalities, including heart rate and rhythm.

⚠ Patients who manipulate the Pulse Generator and Bipolar Lead through the skin may damag or disconnect the Bipolar Lead from the Pulse Generator and/or possibly cause damage to th vagus nerve.

On Catching Myself Taking One Step To The Left

I changed my mind. I originally had planned to use this opening paragraph to suggest to the "exceptional parent" contingent of EP readers that they bypass this month's *Editor's Desk*. "Go on," I had planned to write, "just ignore this; it's intended for direct support professionals, teachers, therapists and physicians." It's not applicable to parents and it might only infuriate them. "Move on," I was going to write, "and we'll meet up at *Search & Respond*." But I changed my mind. The more I pondered the message I wanted to impart, the more I thought about the experience that prompted this editorial, the more I realized that parents also should read it. And I realized that parents would not only be able to relate to it but, by inviting them to read it, I was also acknowledging something that is often overlooked by professionals—the "humanness" of exceptional parents. Exceptional parents are, after all, simply human, not exceptionally human, not "Superparent". So now that I've brought you back into the fold, let me share with you something known only to one other person. Let me tell you how, two years ago, I caught myself "taking one step to the left."

I was in the men's room of the Morton J. Kent Habilitation Center in Chattanooga where, as most EP readers know, I'm the Director. The Kent Center serves as the think tank at Orange Grove, conjuring up innovative approaches to supporting people with complex biopsychosocial and developmental disabilities. While I washed my hands at the sink before leaving (as per the OSHA-required wall sign, not to mention validation of Koch's germ theory of 1879) I noticed a student in the mirror.

The Orange Grove student was sitting on the toilet with the cubicle door wide open. When I turned around to encourage him to close the door to provide himself with some privacy, I realized he'd had an "accident" and had soiled himself.

I looked around to see if he was accompanied by a classroom assistant and saw that he was alone. Perhaps the assistant is female, I thought, and is waiting outside for him. So I walked out, ready to alert her that she was needed. No one was in sight, so I surmised that the student had self- toileting skills and was on his own. I assumed he would return to the classroom, where his needs would be attended to and he would be changed. After all, I thought, those classroom teachers and assistants know their students better than anyone, and toileting is part of their routine and protocol. He'll be cleaned, powdered and changed within the next five minutes. I was confident in that as I walked toward the fountain in the center of the atrium of the Habilitation Center. Besides, the budget worksheets for next year were unfurled on my desk and I had to have them completed by the end of the day.

The fountain sits almost as an apex to a fork in the road. To the left of the fountain are the offices, conference and planning rooms of the Habilitation Center and to the right is the hallway leading to the classroom complex of the center's school division.

Preoccupied with figuring out how to stretch my conference and meeting resources for the upcoming year, I got closer to the fountain. With an almost-choreographed, fluid motion, my left foot announced to my body that I was going "left," back to my office and back to the budget. At that very instant, as dramatic as the governor calling in a stay of execution with two minutes to spare in some black and white classic movie, my right foot decided to overrule its counterpart. I found myself executing a full pivot, realigning myself. We weren't heading for my office; we were going back to the men's room. The engine room had gotten new coordinates from the bridge, and we were back on course, heading where I should have been going all along. Back to the men's room, to assure myself that the student was as tidy and clean as possible before he headed back to the classroom, where he would be welcomed as a pit crew would welcome a muddy sprint car and, as fast as possible, prepare him for another go at the track. What was I thinking? I thought. How did I ever get to where I took even one step toward the left? What mechanism kicked in to "right" myself? As I stood at the sink encouraging the student to wash his hands, I looked at the mirror and saw myself looking back.

Why had I left the bathroom in the first place? I could have come up with a compelling list of reasons, but I jettisoned them all and had a mini-celebration. The road not

taken (back to my office) was a dramatic near miss. I had somehow fixed on the wrong focus. My preoccupation with conjuring up innovative strategies to support people with special needs had almost caused me to lose sight of an obvious "innovative" opportunity right in front of me. My myopia, my priorities, my own press had, at least at that moment, led me astray. My fascination with robotics, Johns Hopkins, the Surgeon General, titanium, voice recognition software and periorbital activated environmental controls had almost allowed me to overlook the joy and sensibility of doing the right thing at the right time. A small thing, perhaps, but nothing was greater at that moment. I was reminded of an ancient Hebrew saying that reemerged during the Holocaust as commentary on the mass indifference: "If not me, then who? And if not now, when?"

The message here, I think, is for caregivers who are asked to perform the same duties repeatedly. It's for caregivers—including teachers, physicians, nurses, therapists, job coaches, house managers and DSPs—who find themselves doing what they do over and over again. Doing what they always do, especially without dramatic and vivid rewards, can sometimes seem fruitless, pointless, redundant and often inconsequential. It's not.

Exceptional parents, the parents that I originally thought should just skip over this editorial, are often more prone to feeling that these tasks are without end and without merit. Mainstream parents can at least appreciate that changing diapers is finite. Each change brings them closer to the eventual last time they will need to do it. Parents will often share the "memorable joy" of changing diapers with their kids on graduation from law school, or will embarrass them by telling all the details to their new daughters- or sons-in-law. Exceptional parents may never have the recollection of that memorable last time. And so, at times, even exceptional parents can find the tasks to be relentless, unceasing, daunting, unpleasant and monumental. Exceptional parents—like exceptional physicians, exceptional teachers and exceptional assistants—can find themselves taking a step toward the left. It's okay; it's human, it's universal and it's shared.

At the beginning of this editorial I said that I wanted to share this experience that was known only to one other person. Shortly after I took that one step to the left I shared it with my friend and colleague Hal Baker. Hal is the deputy director at Orange Grove and has a feeling for this field like few people I have ever met. He's seen it all and weathered the storms of "new age" wisdoms. "Rick," he said, "taking one step to the left on occasion is fine. It's the second, third and fourth steps that should earmark you for extinction."

Hal knows where we should be headed. I hope we all do. I hope it's to the right.

Orange Grove Center, Chattanooga, TN

"THE VALUE OF OBSERVANT OBSERVATION" TO THE EDITOR:

I am a 30-year-old mother of three whose youngest child has severe CP as a result of perinatal asphyxia. I am also a pre-med student in biology at Towson University in Baltimore, Maryland. I was deeply touched by your insight in the Editor's Desk, "The Value of Observant Observation" (March 2002). You have touched on a subject that is often neglected—especially by academically focused students and residents. I don't know how many times my daughter could have been saved a lot of discomfort and aggravation if residents (as well as attending physicians, at times) had bothered to listen.

Often I find (especially with students and new doctors who have limited experience prescribing anything other than standard therapy) that parents are not even consulted when it comes to planning treatment. Why would anyone ever leave out a parent? How can one be an advocate when left out of the loop? I can think of many problems that could have been avoided had someone asked if we had previously tried a particular therapy. I don't know how many physicians came up with the "brilliant idea" to put my daughter on a particular medication to control her excessive secretions while she was an inpatient. If they had bothered to ask, I could have told them that even in the smallest doses this medication would cause her secretions to thicken, then she would go into respiratory distress. Often people get caught up in the physiology of things and neglect what is right in front of them.

I feel you have touched on a very important issue that needs to be shared, not only with the current medical student population, but with future medical students as well. I thank you for sharing your insight, and I only hope that more people begin to utilize their abilities to make common sense observations.

Natalie Blakeman

"NOTICEABLE DIFFERENCE"

To the Editor:

As an Infant Development Specialist who has been in the field (and often sitting on the floor with a baby) for many years, I have often thought about what you expressed so eloquently in your Editor's Desk ("On Noticing a Noticeable Difference," February 2002). I have had gut feelings and puzzled about whether there was something different/wrong/worrisome in a child or whether it was just his or her individual personality. Your article is so important that I shared it with a colleague at Harbor Regional Center here in the Los Angeles area because we had been concerned about one little toddler and had been speculating along these lines.

Linda S. Dingman, MA
Infant Development Specialist, CA

"GINA AND THE GROUP HOME"

To the Editor:

The article "Gina and the Group Home" (March 2002) should have been entitled "Gina and Her Family's Group Home." The article was disheartening and I hope it doesn't become the trend. It was filled with self-pity and a lot of "what about me" which inevitably became the attitude of the siblings as well. It's a matter of attitude and perspective; is the glass half empty or half full?

To pretend that Gina has not missed her family is a disservice to all children with disabilities. For the special children in our lives, it is not always something we can see but something they can feel. It might be something as simple as the scent of your mother as she bends down to kiss you good night or the way she strokes your hair as you fall asleep. You feel but you cannot respond.

Gina would have still signed, would have still grown and improved. There was no magic in the group home or in the absence of her family. The magic was in the interventions and attitudes of those around her. I also would like to point out that the caregivers at the home will never be consistent; as employees, they will come and go. Gina will never know consistency again. Gina's family had an opportunity to grow as a family, to become unique in their roles as mother, father and sisters.

I am the mother of five children, four girls and a boy. Kevin, our youngest, has global developmental delays and autistic tendencies. Our hands are full, believe me, but not how you may be thinking right now. Our hands are full of love, patience and hope for the future. I wish only the best for families who are facing times of despair. It's too bad this family in crisis could not have been helped instead of being separated. With a renewed attitude and renewed spirit, this family could be together again. That's my hope for Gina and her family.

Deirdre Finnegan Shea
Worcester, MA

To the Editor:

I finally got around to reading the March 2002 issue. The article by Phyllis Donovan titled "Gina and the Group Home" really touched me. My son is 9 1/2 years old, severely mentally disabled (he has tuberous sclerosis), totally lovable, has autistic characteristics and is nonverbal. So the article really hit home.

I saw at the end of the article that the Donovans live in the New York metropolitan area. I'd like to learn more about (this group home), for the future, for my son.

Anne Campbell, NY

We encourage letters on any subject. Send them to: EP Magazine, Attn: Letter to the Editor, 65 East Route 4, River Edge, NJ 07661; Fax: (201) 489-0074; or E-mail: epedit@aol.com. Published letters may be edited for space and clarity. Unless otherwise requested, writers will be identified by full name and state. Please include your phone number and/or e-mail address on all correspondence.

HARD MANUFACTURING

AGE APPROPRIATE

BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

The Stockton features full crib safety sides

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

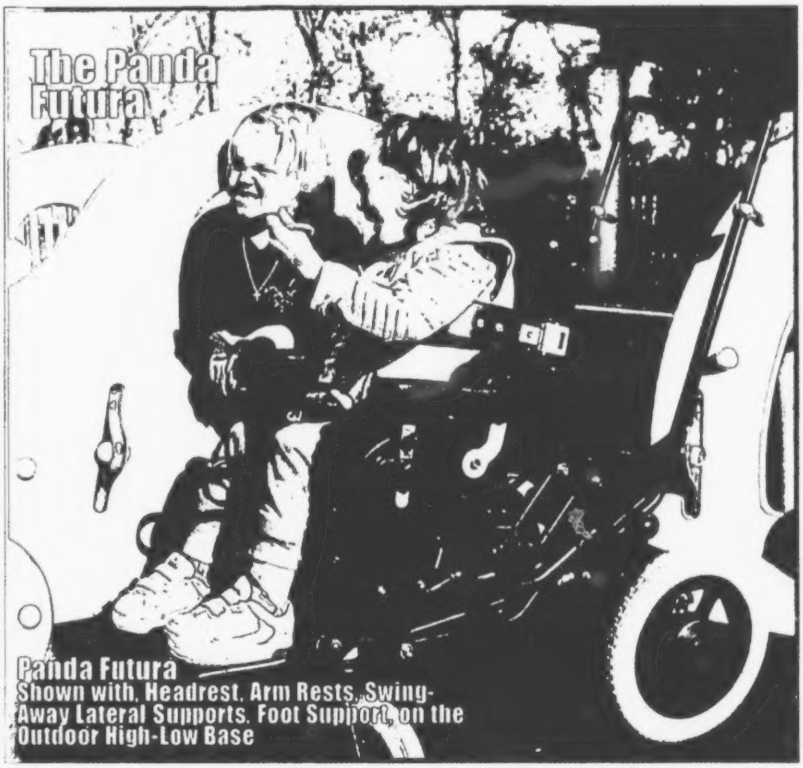
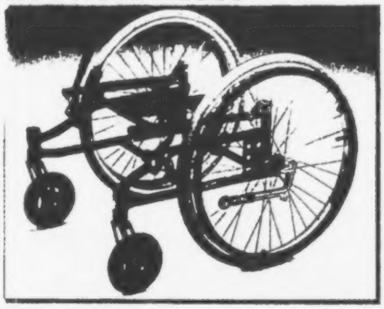
Where Parents Keep Up To Date On Products For Their Children's Special Needs



Panda Futura
Shown with, Headrest, Arm Rests, Swing-Away Lateral Supports, Foot Support, on the Outdoor High-Low Base

Our Panda chair is one of our most versatile seating systems. With its adjustable seat, wide variety of options, and different frames, the Panda Futura can solve almost every seating situation your child may face.

Wheelchair Base



Our Different bases allow you and your child to do more and be more places. The Wheelchair Frame (Left) is the perfect option for the active child who likes to explore their surroundings.

The Tiger Stroller frame (Right) folds easily for transport and storage. It is a great option for family walks.

Our High-Low Frames allow your child to "be where the action is", by adjusting from floor height for interaction with peers, or at desk height for any home or school activity. The Outdoor Frame (Above) offers rugged wheels for all terrains, while our Indoor Frame (Lower Left) is smaller and easy to manuver around the home or classroom.

Indoor High-Low Base

Spinal fusion surgery

My 15-year-old daughter does not seem uncomfortable now, but doctors tell us that without spinal fusion surgery she will eventually be unable to be in a sitting position. My daughter uses a wheelchair, is not able to speak, and has chronic digestive discomfort. Her response to the discomfort is to rock violently in her chair.

I worry that she'll have pain after surgery due to problems with hardware because she is so active. We limit her diet and are able to keep her comfortable and happy most of the time, but still the violent rocking is very common for her. She also loves to spend time on the floor: she rolls, pivots, and spends hours propped on her elbows playing with tape player (loves music).

Has anyone in this position refused surgery and found that the worst didn't happen as doctors warned? I want to do what's best for her, but have such fear of taking away her joys and giving her discomfort. Information about positive experiences with the surgery would be helpful, too.

—459, via EP Web site

Dr. Feudtner: Whenever considering how to care for a child with special needs, it can be very useful to ask: what are we trying to accomplish? For your daughter, you have an immediate concern (her digestive discomfort) and a more distant concern (potential future discomfort when sitting due to progression of her scoliosis). To address her apparent gastroesophegeal reflux disease (heart burn), is she already on a proton-pump inhibitor, like omeprazole? She really should be, as these medications have been shown to improve the quality of life for children with significant heart burn. Regarding the scoliosis surgery, you should feel comfortable asking your doctors the following questions: Why should we do this surgery now, and not in a few years? (Usually, the answer is because they can only reduce the curve in the spine by about half, so letting it progress further will ultimately mean a larger permanent curve.) What are the potential benefits of the surgery? (More comfortable sitting and easier breathing?) What are the risks? (As with any surgery, there are several important ones that you need to discuss openly with your doctors.)

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our Web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our Web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S

Filling a cavity may be difficult

My 20-year-old son, Steven, who has mental retardation, has a dental cavity for the first time in his life. The pediatric dentist who was wonderful with him retired a few months ago. The dentist who took over the practice is unable to even clean Steven's teeth, let alone think about filling a cavity. He has proposed setting Steven up for intravenous anesthesia just so he can fill the cavity, although he's never done this before. Steven is on medication for minor seizures, but the dentist has assured me that the anesthesia should not be a problem and that since it should take effect within a minute, keeping the needle in his arm would not be difficult.

I would like to know how other parents have dealt with dental care for their children, especially in a case like this where drilling has to be done.

—210 via EP Web site

Respond

R

GT Difficulty

SH (Feb. 2002) has a grandchild with a gastrostomy tube (GT) which needs continuous venting and which gets in his way and also bleeds at the site of insertion.

Our son, Andrew, has a Ross Stomate™ Low-Profile Tube (http://www.ross.com (800) 258-7677), which has been wonderful! It doesn't need to be vented. It is only changed about once every two to three years. It is made out of heavy duty plastic, it looks like a little Chinese lantern, and it is installed by a doctor with a special little instrument. It has allowed Andrew to learn to burp on his own. It is flush to the skin, so he can roll all over the place without harming himself or the g-tube.

—JP, via e-mail

My daughter also had a long g-tube which dangled and frequently was "in the way." I used the webbing used for casts. It is actually a cloth "tube" which is webbed and placed on the child's skin before the casting occurs. I received it from the hospital when she had her g-tube placed. I cut a 5-6 inch length and placed it on her under her shirt. I then folded it up making a "pocket." Inside the pocket I placed the long g-tube. It was always out of the way, it wasn't too confining as it was webbed in design. I washed it out every few nights. You should be able to find this through a home health store or hospital equipment supply place. You could buy a large, sleeveless undershirt and fold up the bottom and place the g-tube in the "pocket." The undershirt may need to then be pinned up as it isn't as stretchy as the web material I described. Good luck.

—KF, via EP Web site

Instant S&R

S **Touching feces**

My 5-year-old daughter has cerebral palsy. She operates at the developmental level of a 6- to 9-month-old. She has a g-tube, is non-verbal, cannot sit up without support and cannot walk. Our problem is when she has a bowel movement, she gets her hands into it. She will put her hand down the waistband of her clothes to access the diaper or if she has on a one piece outfit, she will reach up through the pants leg. She doesn't play in it or seem to enjoy doing this, but appears to do this because she doesn't want a dirty diaper on. She used to wiggle her hips back and forth so we would know she needed her diaper changed. She has stopped this "dirty diaper dancing" and has moved on to this new method to attract attention to her dilemma. We would love to hear any and all suggestions to resolve this issue.

—BE, 345, via EP web site

R My son is now 16 years old and had been doing that for years. We stopped him from doing it seven years ago by putting "bodysuits" on him. This way he can not get into his diaper from the top. He wears long pants that are very light weight but tight at the bottom and almost like girl's leggings. No one ever knows that they are girl's because they are solid colors. We buy the bodysuits from Newport News (http://www.newport-news.com, (800) 688-2830). They have no sleeves and a round neck so they won't show under clothing. Try it—she may stop doing this when she realizes she can't get into the diaper anymore.

Price: $29.95 plus shipping

Did you promise yourself you would be better prepared for your Individual Education Plan (IEP) meeting this year? If so, *Wrightslaw: From Emotions to Advocacy-The Special Education Survival Guide* can serve as your guide, whether you are new to IEPs or a seasoned pro. All the information you will find in this book is presented in a clear and concise format. You will not want to skip a single page your first time through the book, from the section on building you up to be your child's best advocate, to the glossaries of terms. This is the book you will pull out before every meeting, and take with you to most.

Planning for the future is hard to think about, but it is the driving force behind the goals to be written at your IEP meeting. The book outlines a "Master Plan." This process is broken down step-by-step for you with numerous samples as well as other references to assist you. A good master plan includes short- and long-term goals, as well as academic and non-academic goals.

And who will keep all the players focused on your child's master plan? You the parent, of course! Learn all the skills you need to do this well, as you progress through the early chapters. Terms, choices, how the system works, and alternatives are all explained in detail. What to watch out for, how to handle conflicts, complaints and personalities are all covered. You will learn to spot a problem before it becomes a major one with advice you can use again and again.

Problem solving options are presented in every section. You are taught how to manage crisis for the short- and long-term. There will be many times when you will find yourself referring to this section of the book before you react as your child grows.

Tests and evaluations are always something of a mystery to parents. Learn how to evaluate which tests are appropriate and how to use the results in your master plan. Charts and graphs are used to explain test scores so they become meaningful to you. This information will help you in making sure goals are measurable and in evaluating whether a child is truly progressing. The book even gives parents a "homework assignment" which allows them to analyze tests their child has taken in the past. I found the test information to be invaluable in helping me be a strong team member and advocate.

Information on how to organize and store all the "paper work" is also included here. What do you need to keep? How can you organize it so it is meaningful and so you can reference it when it is needed?

With all this new knowledge at your fingertips you are now ready to think about this year's IEP meeting. The Wrights begin by presenting "SMART IEPs." You will look at goals, objectives and benchmarks in a new way. Progress is discussed in terms of how it can be measured and how parents will be kept informed.

Many real examples of children's goals are given. You will have learned so much that it will be easy to see how to improve your current plan. At this point you may want to rewrite your existing IEP even if it isn't time for it to expire.

You will also find a whole section on the law. You may want to bring your copy of this book with you to meetings so that if something is quoted as not being allowed by law, you can check it out on the spot. An informed parent makes a better advocate.

The next section of the book is on "creating a paper trail." The information and tips here are valuable in all conflict situations. Sample forms are used, along with lists of what needs to be included in letters. Whether you need to verify something that was said or clarify your own position, you want to be sure you include everything that is needed. You will use all this information over and over, especially the tips about how to deliver letters to school. You won't want to skip this section!

Parent meetings are negotiations, and you are now ready for the section on how to negotiate while building a strong family-school relationship. While it is natural to be stressed over these meetings, strategies are given to keep things moving smoothly. With all your new skills and confidence your child is sure to come out with a much better program for the future!

Joy Libeskind is director of the Connecticut Parents Resource Library and co-chair of the Greater Waterbury Local Interagency Coordinating Council.

Clay, Danny, Robin and Danielle Wagner live in Fort Lauderdale, Florida. Clay is autistic and has a seizure disorder.

"We're a PediaSure® Family."

"PediaSure helps us give Clay the nutrition he needs."

All kids need proper nutrition for growth and development. If your child is not getting enough of the right nutrition from regular food or has special feeding needs, ask your doctor about the complete, balanced nutrition of PediaSure. It's specially formulated to provide children with proper amounts of protein, fat, carbohydrate, vitamins and minerals. Available in your local supermarket, drug or discount store.

PediaSure
Pediatrician Recommended
Lactose Free

Available through WIC®*

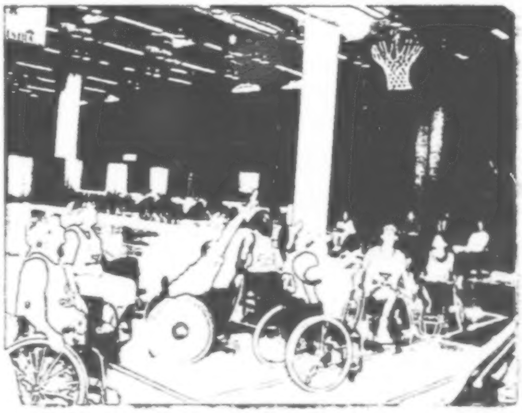
Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002
LOCATION:
Orange County Convention Center—Orlando, Florida

A UNIQUE GATHERING— A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract **physicians • families • direct support professionals • people with disabilities • allied health care professionals • educators • adapted physical education specialists.**



TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more.

EMPLOYMENT SYMPOSIUM PAVILION: Human resource managers will discuss career opportunities.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.

CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation will be provided through approved accreditation institutions.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with the Florida Department of Education, Division of Vocational Rehabilitation Services will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

SHOW PRODUCER: HAB H.A. BRUNO, LLC
IN ASSOCIATION WITH: EP Exceptional Parent
GOLD SPONSOR: sigma-tau PHARMACEUTICALS, INC.
CONFERENCE SPONSOR: EP Foundation for Education, Inc.

WCD'S SPECIAL FEATURES

The World Congress & Exposition on Disabilities (WCD) will offer many special features at this year's event in Orlando, Florida on October 3-5, 2002. Our move to Florida brings about many exciting developments including the addition of an **Employment Symposium and Pavilion**. Sponsored by the Florida Division of Vocational Rehabilitation Services (VRS), a 50 session symposium has been planned to provide participants, individuals with disabilities, VRS staff, employers, and others with an opportunity to engage in various employment focused discussion sessions. The mission of the VRS is employment and increased independence for people with disabilities. They provide services to eligible persons with physical or mental disabilities who seek to prepare for, secure, regain, or retain employment. Anyone may apply for services. The physical or mental impairment must constitute or result in a substantial impediment to employment. The individual's employment outcome must benefit from VRS. The individual must require VRS to prepare for, to obtain, to retain or to regain employment.

The Employment Pavilion, sponsored by McDonald's Corporation, will include human resource managers from dozens of companies including local and national corporations and government agencies for the purpose of discussing hiring opportunities for those seeking employment.

Another Florida connection will produce our **Assistive Technology Pavilion**. The Florida Alliance for Assistive Services and Technology, Inc., (FAAST) is a non-profit organization responsible to provide consumers of assistive services and technology with awareness, access and advocacy for the variety of assistive technology available in the world today. They are a membership organization that helps individuals with disabilities acquire assistive technology and achieve their goals in school, work and recreation. FAAST assists individuals when working with Education, Vocational Rehabilitation, Developmental Services and other organizations and agencies.

At the Assistive Technology Pavilion, you will be able to see demonstrations, participate in hands-on applications, and ask questions about the latest in assistive technology. The pavilion will include special keyboards, pointing devices and accessible computer software that will allow you to work on the computer. There will be furniture on display that will adjust to your needs in a wheelchair or a specialized office chair. The WCD and FAAST hope that you will experience success and productivity using equipment that is readily available. Stop by and try it out.

In addition to work-related equipment, FAAST will also display assistive technology for independent living. They will have many different products for activities of daily living, personal care, grooming, eating and food preparation. FAAST has assistive technology for improving the quality of your life, from working to living as independently as possible.

Last but not least, America's Athletes with Disabilities (AAD) is proud to host the **Sports and Recreation Activity Center** at this year's WCD. America's Athletes with Disabilities is a national organization with the mission to promote and sponsor sports, recreation, leisure, health and fitness events for children and adults with disabilities. More than 100 disability sports events occur each year under the banner of the *Victory Games*.

The Activity Center will feature on-site individual and team competitions, demonstrations and training by elite athletes and opportunities to try-out different sports and sports equipment. Physical fitness and recreational activities for those with more severe disabilities will be included in this year's programming. Visits and autograph sessions with celebrity sports stars are also planned.

The Sports Activity Center, hosted by AAD will be the home for several participating disabled sports organizations and teams from throughout the USA. A visit to the Activity Center can introduce you to the sport and provide you with the opportunities and contacts that you need to join the game back home.

Further to the special features, this year's WCD will offer a conference program of over 150 comprehensive sessions, sponsored by the EP Foundation for Education, Inc., designed to educate many disciplines within the disability community. Attendees will also have an opportunity to examine a wide array of the latest products and services from more than 250 exhibitors representing pharmaceutical, assistive technology, automotive, mobility, durable medical equipment, personal care, insurance, computer, nutrition and many other industries.

EP6/02

WORKING TOGETHER: Computer Technology and People with Mobility & Sensory Impairments

by Sheryl Burgstahler, PhD, and Dan Comden

People with disabilities meet all types of barriers to their independence. However, technology is helping to lower many of these barriers. Computing technology for tasks such as reading, writing, communicating and searching for information on the Internet is helping many people with disabilities gain greater independence.

HOW CAN TECHNOLOGY HELP?

While it is helpful to recognize the specific limitations of an individual, it is more important to focus on the task to be completed and how his abilities, perhaps assisted with technology, can be used to accomplish the goal or task. Specific accommodations can then be explored that provide access to software or to a specific device such as a keyboard or mouse.

This list is not exhaustive; people with disabilities, parents, teachers and adaptive technology practitioners should consider other approaches as well. New hardware and software is constantly under development and promises to continually improve access options. Additionally, many successful accommodations have been made using homemade or other low-tech materials. Following are descriptions of some computing tools that have been used effectively by individuals with disabilities.

MOBILITY IMPAIRMENTS

The specific impact of a mobility impairment and the resulting need for adaptive technology are unique to each individual. The impact of a disability may be mild or severe in how it affects an individual's ability to access a computer.

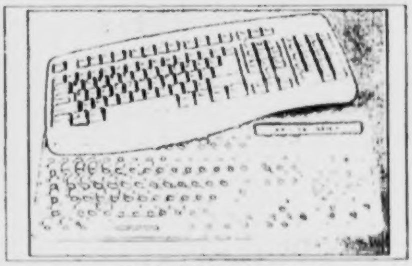
Keyboard Access

The keyboard can be the biggest obstacle to computing for a person with a mobility impairment. Fortunately, those who lack the dexterity or range of motion necessary to operate a standard keyboard have a wide range of options from which to choose. Pointers can be held in the mouth or mounted to a hat or other headgear and used to press keys on a standard keyboard. Repositioning the keyboard to the floor can allow someone to use his feet instead of his hands for typing.

Kensington's Trackball

Before purchasing a complex keyboard option, it is a good idea to evaluate the accessibility features that are built-in on current popular operating systems. For instance, the Accessibility Options control panel in current versions of Microsoft Windows™ contains a variety of settings that can make a standard keyboard easier to use:

- For a person who has a single point of entry (a single finger or mouth-stick), use of StickyKeys allows keystrokes that are usually entered simultaneously, such as Ctrl-key shortcuts found in menus, to be entered sequentially.
- FilterKeys can eliminate repeated keystrokes for a person who tends to keep a key pressed down too long. Check the Settings menu for these features and experiment with different time delays for optimum effect. The Macintosh operating systems have similar features in the Easy Access control panel.
- Consider using the features common in popular word processor programs, such as Microsoft Word™, to ease text entry. The AutoCorrect™



TechAble Keyguard

feature of Word allows sentences or blocks of text, such as an address, to be represented by unique and brief letter sequences. For example, entering "myaddr" could be set to automatically display one's address in proper format. Long words can be abbreviated and entered into the AutoCorrect settings to increase typing speed and accuracy.

Keyguards

A keyguard is a plastic or metal shield that fits over a standard keyboard. Holes are drilled into the guard to help an individual with poor dexterity or hand control press only the desired key without inadvertently pressing other keys. Keyguards are available from a variety of manufacturers (e.g., Don Johnston, TechAble).

Alternative keyboards

Alternative keyboards can be considered for a person who cannot effectively operate a regular keyboard. Keyboards can be smaller (e.g. Tash's MiniKeyboard™) for people who have limited range of motion, or larger for a person has good range of motion and poor dexterity. Several vendors offer an array of alternative keyboards to accommodate a variety of limitations (e.g., Infogrip).

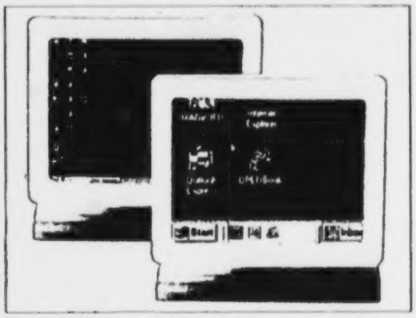
If physically activating a keyboard—whether through changing the settings or switching to an alternative keyboard—is not possible, think about a virtual keyboard. A virtual keyboard appears on the computer screen as a picture of a keyboard. A mouse, trackball or alternative pointing system activates the keys on the screen and inserts the appropriate keystrokes into the desired program. A person can enter text by clicking on specific keys on the keyboard image. Modifier keys such as Ctrl and Alt can also be accessed, as can the function keys. Some virtual keyboards incorporate word prediction (see below) to increase entry speed and may include alternate layouts in addition to the traditional "QWERTY" layout found on standard keyboards.

Word Prediction

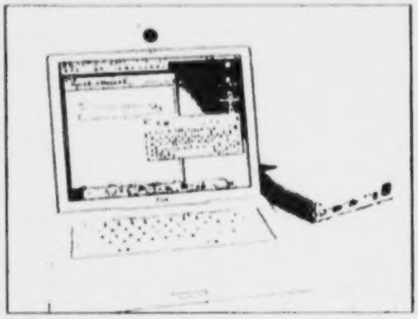
Typing words correctly and quickly can be a challenge for some people with mobility impairments. Word prediction programs prompt the user with a list of likely word choices based upon words previously typed. Some word prediction software automatically collects new words as they are used, and consider a person's common vocabulary when predicting in the future. Word prediction is often used with a virtual keyboard to increase accuracy and typing speed.

Alternative Pointing Systems

With the advent of graphically-oriented operating systems, it is vital to have access to a mouse or an alternative pointing device. For those who lack the coordination to use a standard mouse, there are many alternatives to consider. Trackballs are a good first choice; the control surface can be easier to manipulate and the buttons can be activated without affecting the pointer position. Some trackballs (e.g., Kensington) offer additional buttons that add functionality such as double-clicking, click and hold, and other commands, and can be programmed to a person's specific needs.



Freedom Scientific's MAGic™ Software



The HeadMouse™ mounted
on an Apple iBook™

Other alternative pointers can be found in many mainstream computer stores and supply catalogs. External touchpads, similar to those built into many notebook computers, offer an ideal pointing system for some. Handheld pointing devices such as the ProPoint™ (Interlink Electronics) with a small control surface area may be useful for someone with very limited hand mobility. For people with mobility impairments who already use a joystick to drive a wheelchair, a device such as the Roller Joystick™ (Penny & Giles) may be an excellent choice.

A person with good head control who cannot control a mouse or alternative pointing device with any limb should consider using a head-controlled pointing system such as HeadMouse™ (Origin Instruments) or HeadMaster™ (Prentke Romich). These head-controlled pointing systems use infrared detection and a transmitter or reflector that is worn on the user's head and translates head movements into mouse pointer movement on the computer screen. Use of

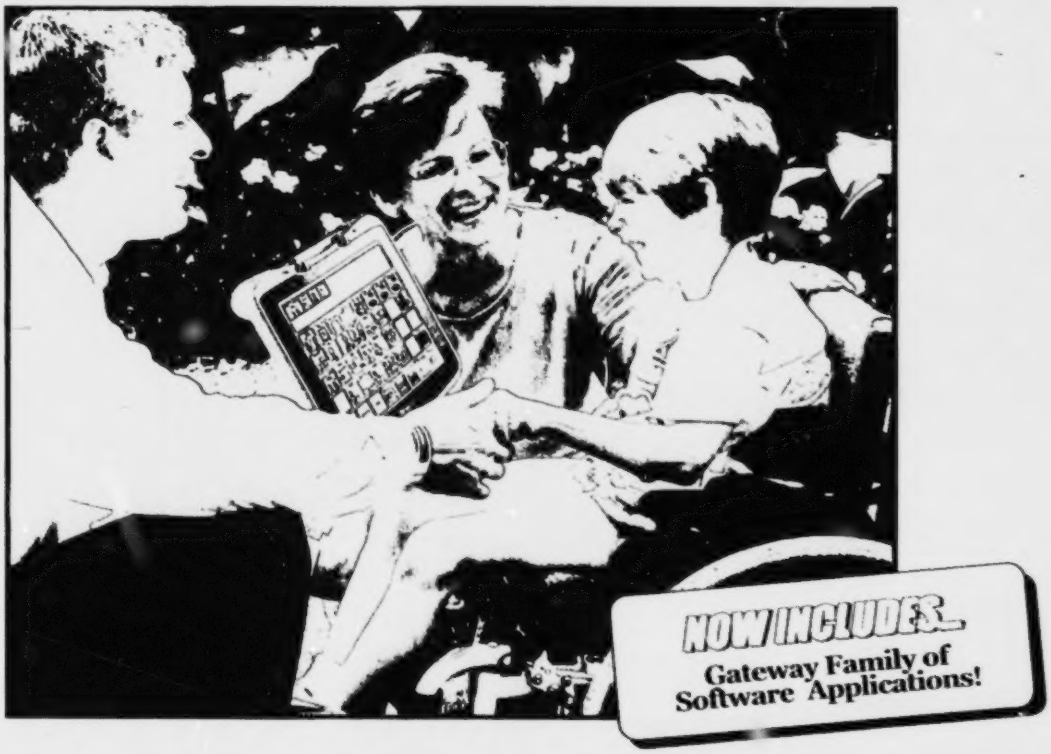
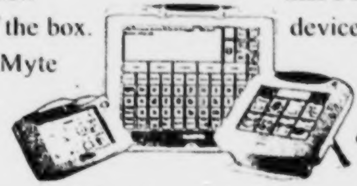
Communications for Life Just Got a Whole Lot Easier.



NOW INCLUDES...
Gateway Family of Software Applications!



Now even more DynaVox communication solutions are available to you right out of the box. When you order a new DynaVox or DynaMyte communication device, or DynaVox software from DynaVox Systems, you'll now receive Gateway to Language and Learning, Gateway 54 and Gateway Junior, all developed by Joan Bruno, Ph.D., CCC-SLP at no additional cost! Plus, as an added convenience, we will install all three Gateway software programs on the device before it is shipped to you. More communicators will enjoy all the benefits of having a pre-designed vocabulary system that's ready to use as soon as their DynaVox device arrives.

DynaVox products have been helping people to communicate for nearly two decades. All of the professional associates at DynaVox are committed professionals dedicated to preserving dignity and pride...offering compassion and understanding...providing first quality communication products for the ones you love the most.

By making Gateway part of the DynaVox package, we're staying in touch with the kind of communication solutions that professionals want and our customers need.

Discover
New England Village, Inc.

"A community rich with opportunity, sharing and growth."

Established as a non-profit corporation in 1972, New England Village is a warm, caring stable and secure environment where young adults with mental retardation can lead a high quality lifestyle with opportunities for growth and friendship.

Our campus, set on 80 beautifully wooded acres just 25 miles south of Boston, offers attractive contemporary style homes and townhouse apartments. Learn about our full range of residential options, extensive vocational and education programs, and wide spectrum of recreation and social opportunities. We invite you to meet our dedicated and caring staff and speak to other families about our village.

Call (781) 293-5461, or write Judy Andracchio, Admissions Coordinator, to arrange your personal visit or request our brochure. We invite private and state-sponsored referrals.

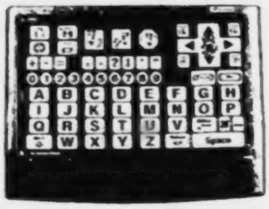
continued from page 29

an additional switch (see Switch Access below) replaces the mouse button. Combining a head pointing system with an on-screen keyboard allows full computer control to someone who cannot use a standard keyboard and mouse.



Infogrip's Discover:Board™

Switch Keyboard and Mouse Access Using Scanning or Morse Code

When a person's mobility impairment prevents the use of a standard keyboard or mouse, using a switch may be a possibility. Switches come in a wide array of styles and can be controlled with nearly any body part. Switches can be activated with a kick, swipe of the hand, sip and puff by mouth, head movement, eyeblink or touch. Even physical closeness can activate a proximity switch. These switches work in concert with a box or emulator that sends commands for the keyboard and/or mouse to the computer.

There are a variety of input methods that rely on switches. Scanning and Morse code are two of the most popular. Upon activation of a switch, scanning will bring up a main menu of options on the screen. Additional switch activations allow menu items to be narrowed down to the desired keystroke, mouse or menu action. Morse code is a more direct method of control than scanning and, with practice, can be a very efficient input method. Most learners quickly adapt to using Morse code and can achieve high entry speeds.

Switch systems should be mounted with the assistance of a knowledgeable professional, such as an occupational therapist. If mounted to a wheelchair, it is important that switch mounting does not interfere with wheelchair controls. Seating and positioning specialists can also help determine optimum placement for switches, reduce the time in discovering the best switch system and maximize positive outcomes.

Speech Recognition

Speech recognition software converts words spoken into a microphone to machine-readable format. The user speaks into the microphone either with pauses between words (discrete speech) or in a normal talking manner (continuous speech). The discrete speech system, although slower, allows the user to identify errors as they occur. In continuous speech systems, corrections are made after the user is finished speaking. Speech recognition technology requires that the user have moderately good reading comprehension in order to correct the program's text output. Voice and breath stamina should also be a consideration when evaluating speech recognition as an input option.

Reading Systems

An individual who has a difficult time holding printed material or turning pages may benefit from a reading system. These systems are typically made up of hardware (scanner, computer, monitor, and sound card), Optical Character Recognition (OCR) software (e.g., Arkenstone's WYNN or Kurzweil 3000), and a reading/filing program. The system provides an alternative to reading printed text. Hard copy text is placed on the scanner where it is converted into a digital image. The image is then converted to a text file, making the characters recognizable by the computer. The computer can then read the words back using a speech synthesizer and simultaneously present the words on screen.

Low-Tech Tools

Not all assistive technology for people with mobility impairments is computer-based. The use of such common items as adhesive Velcro to mount switches or power controls can provide simple solutions to computer access barriers. Often, tools of one's own making can provide the most effective and comfortable accommodations for mobility impairments.

SENSORY IMPAIRMENTS

As computers and operating systems have become increasingly sophisticated, adapting computers for use by people with sensory impairments has posed increasing challenges. Because sound was rarely used, people with hearing impairments experienced few limitations in operating the early personal computers. Not long after the introduction of the personal computer, software and hardware systems for reading screen text out loud were developed for people with visual impairments.

The advent of graphical interfaces (e.g., Microsoft Windows™ and Macintosh OS™) complicates computer access for people who cannot see the screen, since their speech output systems are designed to read text. Multimedia output that uses audio is not accessible to

continued from page 33

those people who cannot hear and people who cannot feel a keyboard cannot type effectively. Fortunately, specialized hardware and software can make computer systems usable by individuals with a sensory impairment.

VISUAL IMPAIRMENTS

The most common accommodation for a computer user with a visual impairment is to enlarge the display of a monitor. This is accomplished using screen enlargement software. Various screen enlargement packages offer a variety of features. The most popular features enlarge the display from two to 16 times the normal view and invert screen colors for those who are sensitive to the usual display of white text on a black background. Some enlargers also incorporate speech output to reduce the strain associated with reading large blocks of text. Commonly used enlargement software includes ZoomText Xtra™ (Ai Squared), Magnum™ (Artic), MAGic™ (Freedom Scientific), and Lunar™ (Dolphin Access Systems).

Screen enlargement technology combined with a scanner can be used to magnify printed text. Once a page is scanned using a standard desktop scanner, the results are displayed in large print on the computer screen.

People who are blind access computer output with speech and/or Braille output systems. Speech output is the most popular form of access. A variety of products have been created for working with the Microsoft Windows™ operating system. Most people who are blind use a standard keyboard as an input device, since using a mouse pointer requires accurate eye-hand coordination. Screen reader software uses pre-defined key combinations for review and navigation of the computer screen and is usually compatible with most standard software, including word processing, Web browsing and electronic mail. Examples include, but are not limited to, HAL™ and SuperNova™ (Dolphin Access Systems), JAWS™ for Windows (Freedom Scientific), outSPOKEN™ (Alva Access Group), and Window-Eyes™ (GW Micro). People who are blind using a Macintosh are limited to outSPOKEN™.

Refreshable Braille displays are devices that echo information from the screen to a panel with Braille cells. Within the cells are pins that move up or down based on the text transmitted. Braille displays can provide very effective accommodations for users who require precise navigation and editing, such as when creating computer program code that isn't pronounced well with speech. Displays such as the BRAILLEX™ (Papenmeier) and Delphi™ (Alva Access Group) also provide navigation and orientation information to the computer user who is blind.

For novice screen reader users who need access to the World Wide Web, consider dedicated Web browsing software that incorporates speech and/or large print. These browsers ease the process of navigating complicated Web sites, and simplify Web

Circle #41or visit www.eparent.com/adinfo

searching as well as reading of Web sites. Home Page Reader™ (IBM) and Connect Outloud™ (Freedom Scientific) are two of the many examples of this kind of software.

HEARING IMPAIRMENTS

There are few adaptations available (or necessary) for people with hearing impairments using standard computer productivity software. Sound is used little in mainstream applications such as word processing or e-mail and, when it is used, there is often a visual alternative. Built-in operating system features found in the control panels of Windows software and the Macintosh computer provide visual displays for system-generated beeps.

The increasing use of streaming multimedia is a concern for those who can not hear. Content developers rarely include captioning in video presentations, nor do they transcribe the audio into text. Resources from the National Center for Accessible Media (NCAM) and Microsoft are available for content developers to add captioning to streaming video.

LIMITED SENSITIVITY

Loss of sensitivity in hands and/or fingers due to peripheral neuropathy or other causes can make it difficult or impossible to use a standard keyboard and mouse. People with this type of sensory impairment can benefit from the use of speech input software such as NaturallySpeaking™ (Dragon Systems) or Voice Xpress™ (Lernout & Hauspie) to control a computer and enter text. Because Neuropathy may be accompanied with vision loss, use of speech output may also be required. JawBone™ (Next Generation Technologies) is middleware—software that serves as a go-between for

two other programs—that allows JAWS screen reading software to work with Dragon NaturallySpeaking.

EMPOWERING THE USER

It is important to remember that the specific need for adaptive technology is unique to the individual. Trial-and-error may be required to find a set of appropriate tools and techniques. The end user—the person with a disability—should play a key role in determining what works best.

Sheryl Burgstahler, PhD, is the Director of DO-IT, Co-director of Access IT, and Assistant Director of Information Systems at the University of Washington.

Dan Comden is the Manager of the Adaptive Technology Lab at the University of Washington. In that position he helps students, faculty and staff select and use adaptive technology and consults with campus units about making their computer labs and Web pages accessible.

Technologies for People with Cognitive Disabilities

TECHNOLOGY

In Education & Daily Living

by Vanessa B. Ira

The Coleman Institute seeks integration of high tech into daily life.

The Coleman Institute's Associate Director, Michael Lightner, Director of Advancement, Enid Ablowitz, founders Claudia and Bill Coleman, and Executive Director David Braddock (l-r).

Early last year, the University of Colorado received a $250-million gift endowment from William "Bill" Coleman, III. The gift is being paid over a period of five years toward the building of the University of Colorado's Coleman Institute for Cognitive Disabilities. Bill and his wife, Claudia, had decided that they would give back to society, doing so for the community of people with special needs—while harnessing his knowledge of computers, honed from the early years of his career as an executive at Sun Microsystems. Coleman is currently the chairman and CEO of his own company, BEA Systems.

"In 1993, I ran software development for Sun Microsystems and because of some success, I was able to retire." Bill relates. "But I didn't know what I wanted to do. I've always been a goal-oriented person. When I was in the Air Force, I said when I'm done I'll run a Fortune 500 computer company by the time I am 45. I made that by the time I was 41. Then I set a goal to build a $100-Million software company from scratch by the time I was 50. At 45, I set a goal for when I reached 55: I would create what I called a 'life to go to' —a life that would make me excited about getting up every morning until I'm 80.

"I decided that I wanted to have a balance between three things: one, being involved in the computer industry; two, giving back, particularly for the disabled; and three, spending some time on civic activities and traveling."

The Colemans had a personal interest in wanting to aid people with special needs having witnessed their niece, who has cognitive disabilities, grow up and benefit from the use of a computer starting at the age of 5. "She's now working, helping out in a hospital," Coleman says. He is proud of his niece's achievements, although he also notes that she has not been able to live independently. Here, he feels, lies the role of technology.

"As the world becomes more wired, systems around you are going to become aware as well," Coleman explained. "For example, helping you get to your hotel room and having the system be able to unlock the door for you-these are the kind of things that will really help people with cognitive disabilities be able to relate to their environment in a much-better way, on an individual basis."

The goal for Coleman's philanthropy was to be able to fund two parts, first by building a permanent endowment for the research that is turned into the Coleman Institute. "But it had to be enough of an endowment that it could provide a center of excellence," Bill stresses. "What I worry about in this area is that nothing is integrated. It's all being done by providing a small grant here and a small something there. There's no way to really leverage where technology and the whole clinical research area are going. What we're doing is moving within the areas of research, to computer science and cognition, special education, all the way to the family community."

The Colemans began building the foundation of the Institute for Cognitive Disabilities by gathering a team of accomplished individuals to set the wheels in motion.

David Braddock, PhD, came on board as executive director and associate vice president for research for the University of Colorado in August of 2001. He is the former president of the AAMR, the former head of The Department of Disability and Human Development at the University of Illinois at Chicago and is an expert on the study of cognitive disabilities. Currently, the Institute is sponsoring 13 research grants on cognitive disabilities for the four-campus system. The Institute also recently concluded a national conference on Philanthropy in Developmental Disabilities for University-based centers in DD from 36 states, co-sponsored by the Association of University Centers on Disabilities.

Michael Lightner, PhD, serves as the Institute's associate executive director. He is also associate dean for special projects and professor of electrical and computer engineering, as well as vice president for technical activities for the Institute of Electrical and Electronics Engineers.

Elizabeth Hoffman is the president of the four-campus University of Colorado Systems which has 46,000 students.

Bill Coleman will be actively involved with the Institute, as will Claudia, who is a former manager for Hewlett-Packard.

"One of the things we've done was set up this Institute and set it up so that the Institute reports to the University," Bill says. "And it owns all the intellectual property. Now, the reason for that is I believe there will be what we call the 'space program effect' from the 60s. There'll be a huge market for companies to adapt this technology for many commercial reasons. The royalties from that should come back into the Institute to build endowments so that we can even continue to increase the research. The byproduct of the endowment are fellowships and scholarships that would form a base of academic and clinical research and other experts."

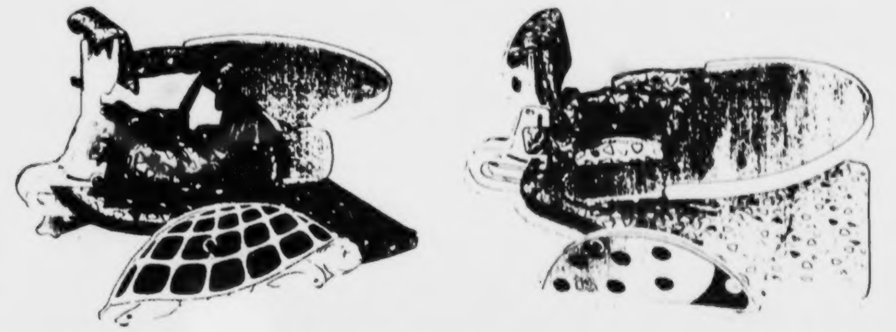
Coleman looks to developing such an integrated system that continues to endow research so it is richer and fuller and expansive across all the campuses of the University of Colorado and also in other universities.

On the subject of how people learn and retain, Coleman explains: "Now we can build a computer model. We can build tools, such as what's going on now with 'personalization' that can actually adapt to interfacing with individuals, based on not just their disabilities, but also on the individual's way of learning and adapting. You can build a database over time. In a world where everything's connected going forward, that system can interact with systems around you. When there's a problem, there can be real-time connectivity to real practitioners and helpers, who are somewhere else, anywhere in the world."

"To me, the natural advances of technology, and the ways they are being implemented, are going to provide the infrastructure to do this. What we need to do is provide the ability to continually build this taxonomy, the systems and support structures that can continually learn to adapt better to the abilities and disabilities of individuals, their personal learning and retention. We need to understand that and how best to interact with it. I mean, they're going to have global positioning satellites go right into it. That's already coming because of these wireless applications. They're going to know right where you are."

Coleman's years at Sun Microsystems have helped shape his vision for technological research at the Institute: "Our vision was centered on the idea of the network becoming the computer. The convergence of communication and computing would mean that what we considered a portable telephone 10 years ago would have all of the capabilities of computer or personal digital assistant, telephone and everything. That device working on a network is going to do everything that a computer and a personal assistant can do. If the basic infrastructure is going to be there, endowing the research to be able to build the toolkit around it that adapts it to the mental condition, the learning abilities and cognition of the individual could be hugely reinforcing."

In the end, Coleman wants to "insure that that there be center of excellence. Once this really gets building, we want to fund a company that could exploit the technology as a non-profit. So that to the extent that company can make profits, all those profits will go into making the technology available to those who can afford it." ■



Stretch their body as well as their imagination.

These unique positioning tools have an innovative tilting seat that puts your child in a more functional position, encouraging reaching and extending, helping them with upper extremity and head control.

They're also built with the innovative Multi-grip™ hip guides that makes sitting more comfortable, thereby promoting a hamstring stretch that assists in the prevention of tight knees.

With all this stretching for their body, it's only a matter of time before they begin to stretch in other ways. At first a smile. Then, believing anything is possible.

THINKING READERS

Part II: Supporting Beginning Reading in Children with Cognitive Disabilities through Technology

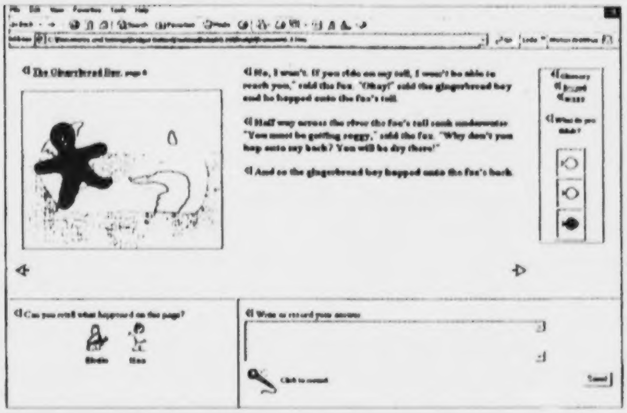
by Lucinda M. O'Neill and Bridget Dalton, EdD

Eleven-year-old Becky is totally absorbed in the electronic picture book on her computer screen, a digital retelling of the classic folk tale, *The Gingerbread Boy*. Using brightly colored illustrations and simple text, *The Gingerbread Boy* tells the story of a gingerbread cookie that escapes from the oven and has a series of encounters with animals who want to eat him. Becky, who has Williams syndrome, a genetic disorder that causes physical problems and developmental delays, has reached the part in the story where the gingerbread boy tries to cross a river by hitching a ride on the back of the wily fox.

"Oh, no," Becky exclaims, staring intently at the illustration showing the fox's back sinking into the water as the gingerbread boy perches on his head. "What do you think about that?" asks Peggy Coyne, a CAST researcher. "He'll drown," Becky predicts. She clicks on the text to have it read aloud to her and then quickly moves to the next page to find out what happens next. "Oh, no," she cries out again as she looks at the illustration of the fox sitting on the river bank, licking his lips "he (the fox) ate him!" "How do you know?" asks Peggy. "Because I don't see him!" Becky exclaims.

Later, a learning prompt embedded in the digital picture book asks Becky to describe her favorite part of the story, either by typing her response in a text box or recording her response orally. "My favorite part of the story is when the fox ate the gingerbread boy," she says. "Do you want to type that?" Peggy asks. "No, I want to record it," she responds decidedly. Becky records her response three times before she is satisfied, smiling and clapping her hands at her accomplishment.

Above: Becky, who reads at the first-grade level, builds oral fluency by retelling the story of the Gingerbread Boy using the program's recording feature. Inset: The wily fox character. (Illustration by Kathy Dalton.)



"No, I won't. If you ride on my tail, I won't be able to reach you," said the fox. "Okay!" said the gingerbread boy and he hopped onto the fox's tail.

Half way across the river the fox's tail sank underwater. "You must be getting soggy," said the fox. "Why don't you hop onto my back? You will be dry there!"

And so the gingerbread boy hopped onto the fox's back.

Can you retell what happened on the page?

Write or record your answer

Above: Sample screenshot from CAST's digital version of The Gingerbread Boy© with embedded reading supports for children with cognitive disabilities.

Left: Using the Thinking Reader picture book program, James (pictured with CAST's Bridget Dalton), is in control of the computer and the mouse.

Raising expectations

It is an unfortunate truth that many children with severe cognitive disabilities have not had the opportunity to fully realize their potential because of low expectations for their development in the area of literacy. With conventional approaches to teaching reading, children with such disabilities often are not able to learn to read at a functional literacy level. Traditionally, literacy instruction for these children has focused on drill and practice; however, recent research by Koppenhaver and Erickson and their colleagues at the Center for Literacy and Disabilities Studies suggests that these students benefit from the same research-based instructional approaches that work for other students who are learning to read. That is, reading instruction that:

- Focuses on reading for meaning,
- Provides direct instruction in reading skills such as phonics and decoding (word recognition), and
- Offers children a wide choice of appealing literature.

Becky is one of seven children with cognitive disabilities who are involved in CAST's Thinking Reader Project. Funded in part by the Joseph P. Kennedy, Jr., Foundation, the project draws on a well-established research base in how children learn to read as well as a new educational approach pioneered by CAST called Universal Design for Learning, which weds current research in how the brain learns with the flexibility of multimedia computer technology. The project is creating digital versions of popular children's stories that include a variety of built-in supports for the development of beginning reading skills in children with cognitive disabilities. "The project is about expanding possibilities and raising expectations for the literacy development of these children," says David Rose, CAST's co-executive director.

A powerful teaching tool

Unlike traditional print books, digital text has the flexibility to change in relation to the instructional goal and the individual learner's characteristics. The Thinking Reader picture books provide three instructional foci: comprehension strategies, story grammar, and decoding. In the opening scenario, the instructional goal was comprehension and Becky's attention was focused on making sense of the story. Decoding was not an issue, since she could click on the text to have it read aloud. On another day, the instructional goal might be word recognition. When working on oral reading, Becky clicks on the decoding supports to help her sound out the words and practices reading aloud into the computer microphone. She records and listens to herself read, engaging in repeated readings that help her build her word recognition skills. On yet another day, Becky learns about character and plot as she responds to story grammar prompts. The Thinking Reader's flexibility in enabling teachers to set the goal of a learning activity increases Becky's opportunities for success and keeps her engaged in the targeted learning task for extended periods.

While it is possible for children to read electronic storybooks by themselves after some initial training, the Thinking Reader is designed to support an instructional dialogue between the child and a teacher or instructional aide. Students are put in charge of the computer mouse

continued from page 41

and choose many of the activities they want to pursue within the program. The teacher plays a key role, guiding students in responding to the learning prompts embedded in the stories. "It allows the teacher to have a conversation with the child about the text, moving beyond a rote response to the story or an over-reliance on yes and no responses," says Ron MacAdow, an instructional designer and manager of the Thinking Reader Project.

For example, asking students to retell a story in their own words is an exercise that contributes to both comprehension and the development of verbal skills. Erica, a student with cognitive disabilities for whom English is a second language, retells the story sequence in which the fox eats the gingerbread boy. "The fox say hop on my back, my tail is soaking wet," Erica relates. Moving to the next screen, where the fox is shown sitting alone in the grass licking his chops, she laughs out loud. Next, she clicks on the picture and hears the fox say, "Mmm, mmm, I love to eat gingerbread cookies," confirming her guess about the fate that has befallen the gingerbread boy. "At the end, he (the gingerbread boy) didn't listen again, all the time the cookie didn't listen. He doesn't have a brain," Erica concludes, laughing again.

A promising beginning

By providing children with cognitive disabilities with supports that enable them to make progress in all aspects of language and literacy development—reading, writing, listening, and speaking—CAST believes that the Thinking Reader and similar programs can help these children can take critical steps towards independence.

Teachers report that they see their students actively reading and responding to the digital picture books in ways they haven't seen before in traditional reading instruction. "I think it's wonderful," one teacher says, citing the levels of support the program offers and the opportunities for children to "take charge of their learning" as specific strengths of the approach. "Children have definite ideas about what they liked about their work," she observes, commenting on how the program offers students the opportunity to listen to their own voices and review their progress. Another teacher commented that the program promotes students' oral language, noting that she observed one child talk more in a single session reading on the computer than she had in the previous five weeks of class.

Parents are also eager to see tools like this more available in classrooms. "I think it's been very positive," Becky's mom says of Becky's involvement in the program. "Her reading is taking off. Before I thought her reading was more sight words or from memory, and now we can be out on the street and I'll say, 'What does that say?' and she can tell me."

CAST's current work with children with cognitive disabilities builds on a three-year study the organization conducted with a different group of "Thinking Readers"—middle school students with learning disabilities (*Exceptional Parent*, June 2001). In this U.S. Department of Education-funded study, CAST researchers evaluated the Thinking Reader approach with 102 students, most with learning disabilities and all performing below the 25th percentile in reading. The study demonstrated that students who used supported, digital versions of age-appropriate novels had greater comprehension gains on a standardized reading test than did a control group of students who did not use computer supports. The students who used computer-based supports also showed higher levels of engagement when interacting with the material and improved "on task" behavior.

Future directions

There is a growing body of research demonstrating the positive impact of computer-supported reading instruction and electronic picture books on students' literacy development. CAST believes that supported digital learning environments are the future of educational technology, and that designing effective learning environments for those students with more severe learning needs will result in more effective learning for all. EP

Lucinda M. O'Neill is a staff writer at CAST, the not-for-profit Center for Applied Special Technology in Peabody, MA. Bridget Dalton, EdD, is Chief Education Officer of CAST.

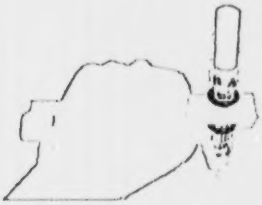
TECHNOLOGY
In Education & Daily Living

LOW-TECH—NO-TECH

Low-tech ideas that don't strain the brain or the budget and promote active participation in the home, school or community.

by Project Participate



Wooden Dowel Marker Support

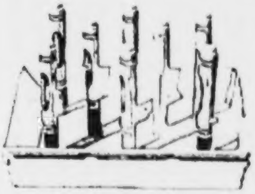
Drill a half-inch hole into a wooden dowel, insert a marker, add two rubber washers to keep the marker secure and increase student participation in name writing or art assignments. Add a marker with letter or number stamps so student can practice writing the alphabet or counting.

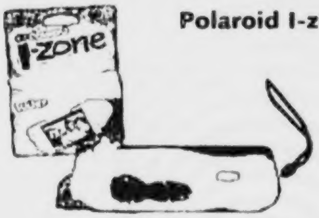
PVC Pen Holder

Construct a pen or pencil holder from the PVC pipe available at most home improvement stores and enable students with a gross grasp to doodle, draw or compose other written work. Drill a 1/4 inch hole into the center of a PVC "tee." Attach this PVC tee and another tee, to each end of a PVC "nipple." The parts are threaded and will screw together. Thread a thumb screw into the drill hole. Place a pencil, marker or paint brush into the tee and tighten with the thumb screw until secure.

Plaster Marker Holder

Instead of relying upon hand-over-hand assistance, enable students to select colors and recap markers independently with a weighted marker holder. Find a plastic container that will hold a one-inch base of plaster of Paris. Add plaster of Paris to the container, insert markers cap-end down and let the plaster harden.





Polaroid I-zone Camera

Increase participation in classroom assignments or homework with this inexpensive camera that takes and develops small photos on the spot. Insert special film with self-adhesive backing and attach photos easily to pages in binders, notebooks, poster paper or more!

Cookie Worksheets

Cookie sheets and magnets give students with decreased motor skills the ability to participate in many writing tasks. Students can slide magnetic numbers into numerical order, sort by odd or even status, attempt greater than or less than problems or add, subtract or multiply in math class. In language arts, students can use alphabet magnets to participate in activities such as letter identification, matching upper and lowercase letters or spelling tests.

Polaroid Camera

Photo essays make great alternatives to poster projects or term papers that entail lengthy detail or fine motor exertion. Polaroid cameras produce photos on the spot for instant satisfaction and results. Students can use the cameras to document lab assignments or other research findings. EP

Discover the faces of Children's Hospital

Everyday we take special care of children. From broken bones to long-term care, from infants to teens. It's our understanding of children and their families that makes us unique.

For over 80 years now, Richmond's Children's Hospital has been providing specialty pediatric care. We understand children. And what it takes to tailor our services to their individual needs.

Take for example, our Pediatric Feeding Disorders Program, one of only a few such services in the country.

Or our Inpatient Rehabilitation Program which helps children who have experienced trauma, disease or impairments return to the activities of daily life.

For adolescents who need subacute care to babies who have never seen the outside world, our Transitional Care Unit is a step toward home. And a place where parents learn to care for their child's special needs.

Discover where children come first.

ASSISTIVE TECHNOLOGY STUDY Begins

by Vince Wetzel

In a move toward grass-roots based research, the National Institute on Disability and Rehabilitation Research (NIDRR) has awarded a five-year, $300,000 per year grant to the California Foundation for Independent Living Centers (CFILC) for unprecedented, in-depth study on the benefits of assistive technology to people with disabilities. The work is getting under way.

As part of the grant, CFILC is incorporating its 29 independent living centers throughout California to work with its members and stakeholders. They are collecting research data on access and use of AT to improve the lives of people with disabilities. Researchers from California State University at Northridge are training participants, including community advocates in research methods and to assist with data collection and analysis. These community advocates conduct focus groups, surveys and action research in their respective regions. Advocates will also train university students to do community-based research related to AT and independent living.

"NIDRR's decision to award the grant to CFILC recognizes the type of infrastructure already in place by the non-profit organization and its independent living center members," said Project Director Patricia Yeager, executive director of CFILC. "Normally, these grants go to Universities, who facilitate the research to a small sample. CFILC's approach allows researchers to train community advocates throughout the state for a larger and more representative sample."

Yeager went on to say, "It's also important to note that consumer involvement is key. We are not doing research on people with disabilities and AT. We are doing research *with* people with disabilities on the effects of AT in their lives."

The Technology for Independence Project is looking at the impact of assistive techology on the lives of its stakeholders, including those with disabilities, their families, friends and employers. CFILC's AT Community Research Network has identified four areas where it will continue to concentrate its efforts, though the research is not restricted to those areas. Those areas are:

Employment Outcomes—With emphasis shifting from helplessness to work, the impact of AT in the workplace is being examined. The Research Network is looking at types of equipment which are helpful in the workplace for people with a wide variety of disabilities doing a range of jobs. The findings will help employers, rehabilitation counselors, secondary guidance counselors and teachers.

Health and Function Issues—This area is focusing on a person with a disability and his or her access to health services using AT. Successful implementation of independent living often depends on the tools that can maintain that independence. Access to accessible mammogram machines, weight scales and other health-related tools are critical to maintain independence. The research is looking at how AT impacts the health and independence of people with a wide variety of disabilities and on those who provide assistance to them.

Technology for Access and Function—Technology for access includes public and private spaces and uses. From digital telephones and their usage by non-digital hearing aid wearers to stair glides for seniors who do not want to move out of their home with stairs, the project is looking at how well AT can help in community and even family involvement. Research will help direct public policy makers to find the solutions needed to help implement the American with Disabilities Act (ADA) with regard to accessibility, public right of way, programs and information.

Independent Living and Community Function—One of biggest benefits to AT is community integration, whether it is giving a voice to someone who cannot speak or allowing someone to get out of his or her house. The project is looking at the common AT items that enable integration of people with a wide variety of disabilities and how those items are found and paid for. It also considers ways AT can be harnessed to provide more community integration throughout all cultural communities.

"By looking at these four criteria, our research will provide better insight into the importance of AT in the lives of people with disabilities," said principal researcher Dr. Tanis Doe, who directs the research project and assists in the teaching of research skills and analysis of the data. "Everyone from families to employers to government agencies will have a better understanding of AT and its impact on maximizing independent living and community integration."

enabled
ONLINE.COM

In the first year of the grant, the AT Community Research Network will report what is already known regarding the issues. Through a statewide conference with AT and independent living advocates and executive directors from the member ILCs in California, the Research Network will identify key issues and begin initial research training. At the conclusion of the year, community advocates will have been trained in methods to begin the project.

By the second year, the community advocates will begin collecting primary data and begin focus group moderation. The data will reveal what consumers need and want from AT and identify the consumers themselves. In the third year, AT Community Research Network will survey the data collection and look at the solid numbers and begin to draw conclusions from the data. It will also reach out to web-users to identify high-end

THE MELMARK SCHOOL

2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Our approved private day and boarding school serves children ages 5-21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Acquired Brain Injuries
- Cerebral Palsy
- Mental Retardation
- Neurological Disorders

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK Ext. 636 or email admissions@melmark.org

Circle #52 or visit www.eparent.com/adinfo

continued from page 47

AT users and impact.

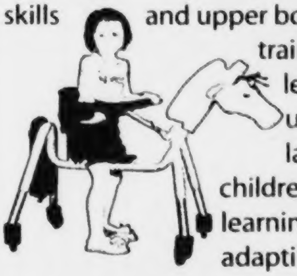
In the fourth and fifth years, the project will be in its final stages, and the AT Community Research Network will begin evaluating and disseminating information. By using data, the Research Network can evaluate the data itself and draw conclusions. These new conclusions, based on these new numbers, will be disseminated to show the impact of AT on individuals with disabilities.

"By year five, a lot of the questions regarding AT and the effect on the integration of people with disabilities in the family, community and workplace will now have solid data to go with abstractions," Dr. Doe said. "We all know AT helps people with disabilities live more independently, but we don't know how much. By the end, we'll have a better idea."

Research will help direct public policy makers to find the solutions needed to help implement the American with Disabilities Act (ADA) with regard to accessibility, public right of way, programs and information.

CFILC is a statewide, non-profit organization made up of more than two dozen Independent Living Centers. Through unified action, CFILC envisions civil rights for all people with disabilities. CFILC's mission is to support independent living centers in their local communities through advocating for systems change and promoting access and integration for people with disabilities. Visit the CFILC web site at http://www.cfilc.org for more information. EP

Vince Wetzel is the Director of Media Relations for CFILC (California Foundation for Independent Living Centers). He may be contacted at (916) 325-1690. This article is adapted by permission from EnabledOnline.com (http://www.enabledonline.com)



R.E.A.L. Design Introduces VIVO™
The New Multi -Therapy Pony

Children will love VIVO, the playful, spirited little pony with the head that bounces when moved and a colorful beaded tail. Parents and therapists will appreciate the valuable skills children gain by playing on VIVO because it functions as a balance rocker or gait trainer by simply interchanging the legs which snap on and off easily. As a rocking horse, VIVO promotes balance reaction skills and upper body postural development. As a gait trainer, it provides incentive for a child to learn ambulation skills. The soft upholstered seat back, with molded laterals, is height adjustable to position children comfortably and securely for rocking or learning to walk. Accessories are available for adapting VIVO to a child's positioning needs.

LEGISLATIVE UPDATE

Federal Assistive Technology Legislation

1988-PRESENT

by Laura Noble

Does anyone remember the time before technology became such a regular part of our daily activities? Those were the days when people still drafted papers on typewriters, got up to change TV channels and had to get to a phone to make a call. Imagine still doing these things because you don't know about computers or remote controls or cell phones. Then think about how frustrating it is to learn about a tool that could ease your daily life—if only you could afford it.

For too many people with disabilities, advances in assistive technology are either unknown, unaffordable or both. For many others, though, their dreams of mastering their environment have become real through the use of assistive technologies. Federal laws enacted over the past two decades deal with "assistive technology"—the Technology-Related Assistance for Individuals With Disabilities Act of 1988 (the "Tech Act") and its successor, the Assistive Technology Act of 1998 ("AT Act").

The first law focused exclusively on assistive technology for people with disabilities. The Association for Tech Act Projects calls the Tech Act a "hallmark piece of legislation that has had a significant impact on the lives of persons with disabilities" and hails it as a "prototype" because of its "emphasis on consumer responsiveness, allowing consumers to be active partners in the process of knowing about, getting and using devices that meet their needs."

The main purpose of the Tech Act was to provide funding to states for the development of "consumer-responsible comprehensive statewide programs of technology-related assistance for individuals with disabilities." A secondary goal mandated the federal government to identify policies and barriers that impeded the provision of and payment for assistive technology.

The Tech Act set out specific components for statewide programs. These Tech Act programs were required to provide information about devices, services, legal rights and remedies; train people to locate and access funding sources for assistive technology; provide advocacy services and legal representation when assistive technology was inappropriately denied; and engage in legislative advocacy to ensure systemic changes in laws, regulations, policies and practices to enhance assistive technology rights. Additionally, states were expected to support the objectives of their Tech Act programs with "systems change and advocacy activities."

The first act created three-year development grants for states and then two-year extension grants. All states were funded at a minimum of $500,000 each per year while territories, such as Puerto Rico and the US Virgin Islands, received $150,000 each. Awards were based primarily on state size and population. Programs were administered by the National Institute on Disability and Rehabilitation Research (NIDRR) within the Office of Special Education and Rehabilitative Services (OSERS) of the US Department of Education.

The Tech Act represented enormous progress in the assistive technology field. "For the first time, the federal government created a definition of assistive technology that could be the standard benchmark for AT in other federal legislation, such as the Individuals with Disabilities Education Act (IDEA) and the Rehabilitation Act," said Ellen Lence. Lence is director of New Jersey's Tech Act program, the Technology Assistive Resource Program (TARP).

The Rehabilitation Engineering and Assistive Technology Society of North America (RESNA) agrees. RESNA is a not-for-profit professional organization that seeks to improve the potential of people with disabilities to achieve their goals through the use of technology. The RESNA Technical Assistance Project continues to provide technical support to the 56 Tech Act projects through a grant from NIDRR. The law "was the first piece of legislation to use the term 'consumer responsiveness' and was the first piece of legislation to be so broad as to cover all disabilities and all ages," said Nell Bailey, Technical Assistance Project Director at RESNA. In fact, the first Tech Act legislation was passed before the Americans with Disabilities Act.

In 1993, Congress reauthorized the Tech Act, which changed the law's objectives and its funding scheme. According to Bailey, the reauthorization for program awards remained the same but the funding levels would be reduced as the programs reached their ninth and tenth years in operation. In the ninth year, Tech Act programs would receive 75 percent of their eighth-year funds and in Year 10, they would receive 50 percent of their eighth-year funds. By Year 10, federal funding for the program would end altogether.

Even more than the original Tech Act, the Tech Act of 1994 impressed upon the states the need for major systemic change. It focused states' activities on six priority areas to strengthen systems change and advocacy efforts. The most important of these emphasized the coordination of activities among state agencies, the development and implementation of strategies to empower individuals with disabilities, the increase of outreach to underrepresented populations and the creation of strategies to ensure timely acquisition of AT.

The problem with the approach [in the original act] was that the Tech Act didn't have authority over such public funding sources as the Division of Vocational Rehabilitation Services but only over its Tech Act projects. [The states] would work with public agencies and suggest changes to create more access to AT, but there really was no legal obligation from them to do so. The Tech Act lacked any teeth, unlike the Americans with Disabilities Act and the Rehabilitation Act, which set forth specific requirements for agencies dealing with clients who have disabilities.

In 1998, Congress repealed the Tech Act and replaced it with the Assistive Technology Act of 1998 ("AT Act"). "There was a recognition that the provision of assistive technology for individuals with disabilities was not so simple," Bailey noted. In justifying passage of the new law, Congress admitted that the state programs were failing to reach many of their goals. The law notes that state programs were deficient in some core areas, including providing sufficient resources to pay for AT devices and services; providing personnel trained in AT; disseminating information about the availability and benefit of AT; and altering systems to ensure that consumers were getting the AT devices and services they needed when they needed them.

The AT Act made some minor improvements over the provisions of the original Tech Act. For instance, the law reduced the six required activities to four: public awareness, interagency coordination, technical assistance and training and outreach. In addition, the law created discretionary activities that state programs could perform with AT Act funds, such as alternative financing systems to increase AT access.

These minor adjustments are overshadowed by the new law's larger deficits. The AT Act, like the Tech Act before it, contains only nominal enforcement provisions. If a state fails to comply with corrective action, then it is subject to sanctions from partial or complete loss of funding, redesignation of the lead agency or exclusion from the grant process the following year. However, the most serious concern about the AT Act lies in its funding scheme. While the AT Act continues funding for state assistive technology programs and extends funding for some states up to 13 years, it severs all state funding after fiscal year 2004. The AT Act's sunset

Changing Lives Forever

The Anne Carlsen Center for Children offers a 60-year tradition of residential, therapeutic and educational services on one campus. Our individualized services include care for children and young adults coping with cerebral palsy; orthopedic, vision and hearing impairments; autism, pervasive and other developmental disorders; and many other medical challenges. Our multidisciplinary team can reach out to you by conducting evaluations in your child's home and school setting.

continued from page 51

clause effectively eliminates 23 states from the grant program before the Act is due for reauthorization.

Without continued funding to implement its goals, experts believe there is little hope of the grand systemic change the AT Act promised. According to Bailey, the AT Act "doesn't allow for permanent sustained funding to ensure access to assistive technology devices and services for individuals on a state and local level. It doesn't ensure that systems change efforts and capacity-building activities will continue. These are the activities that are not likely to be funded by state legislatures."

The Association of Tech Act Projects notes another factor not considered by the law's current funding formula: the number of individuals needing access to alternative resources to pay for assistive technology will increase as welfare reform legislation decreases the number of persons eligible for public program supports. Thus, when even more people with disabilities need assistance to access and use AT, the federal government is cutting off all funds to states to provide this service.

In response to the impending shutoff of federal funds for AT projects, some states have taken action. In Illinois, victims of violent crime can receive compensation from the state for the purchase of assistive technology devices and services. In Kentucky, state legislation established the Assistive Technology Loan Corporation, which provides a resource of low interest loans to consumers to purchase assistive technology. And in Missouri, a state law created an equipment distribution program that provides adaptive devices such as text telephones, amplifiers, telebraillers and hands-free phones to individuals with disabilities. New Jersey has yet to commit state legislation or state dollars to assistive technology for its citizens with disabilities. EP

EDITOR'S NOTE: On January 10, 2002, HR 3061 became Public Law 107-116, making appropriations for the Departments of Labor, Health and Human Services and Education for FY 2002. It provides funding for one-year extensions to existing programs under the AT Act, then phases out federal contributions over a three-year period.

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

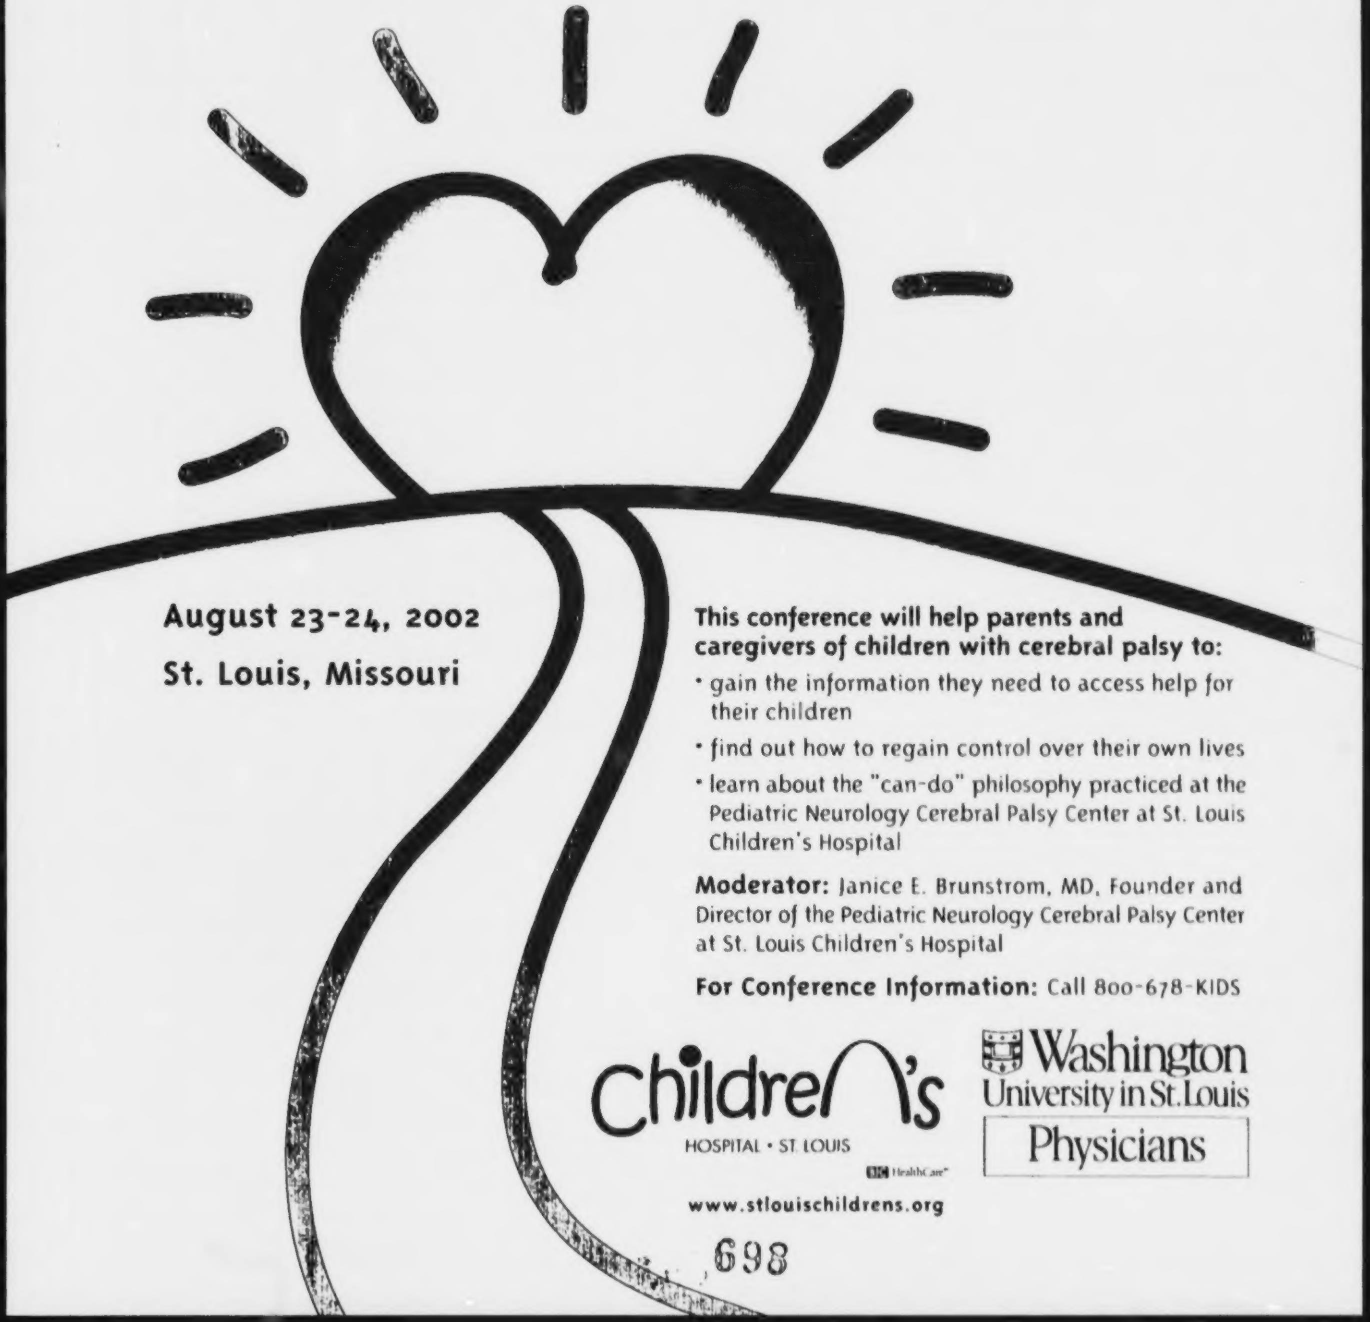
A Conference for Families of Children with Cerebral Palsy



August 23-24, 2002

St. Louis, Missouri

This conference will help parents and caregivers of children with cerebral palsy to:

- gain the information they need to access help for their children
- find out how to regain control over their own lives
- learn about the "can-do" philosophy practiced at the Pediatric Neurology Cerebral Palsy Center at St. Louis Children's Hospital

Moderator: Janice E. Brunstrom, MD, Founder and Director of the Pediatric Neurology Cerebral Palsy Center at St. Louis Children's Hospital

Where can I learn about computer technology that might benefit my child?

by Sheryl Burgstahler, PhD

EP is honored to announce a new monthly column contributed by Dr. Sheryl Burgstahler, director of the DO-IT program. DO-IT (Disabilities, Opportunities, Internetworking, and Technology) began in 1992 with a grant from the National Science Foundation. Funded by the US Dept. of Education, the State of Washington and many other organizations, DO-IT serves to empower young people with disabilities as they transition to college and careers through the use of computers, assistive technology and the Internet. In addition to her role at DO-IT, Dr. Burgstahler is also the assistant director of information systems, computing and communications, the co-director of AccessIT; and the director of the adaptive technology Lab, all at the University of Washington. "Tech Talk" will address practical ways to integrate technology into educational, work and home environments. Dr. Burgstahler will also endeavor to answer readers questions through this column. (Send correspondence to: Dr. Burgstahler, University of Washington, Box 354842 Seattle, WA 98195; fax: (206) 221-4171; e-mail:sherylb@u.washington.edu.

Years ago, we had too little information and too few products that could help children with disabilities gain all of the benefits that computers have to offer. We hear about how assistive technology can level the playing field, but what if you are just getting started? Where can you learn about what is out there? The Internet provides a wealth of information about technology, and specifically about technology for people with disabilities. Here are some of my favorite Web sites:

The Adaptive Technology Resource Center
http://www.utoronto.ca/atrc

Sponsored by the Resource Centre for Academic Technology of the University of Toronto, the site provides information on upcoming workshops, current and completed research projects on assistive technologies and access to the the ATRC library. Also housed by the site is a technical glossary that explains various assistive technology products and provides questions to consider when purchasing them. Information on resource center drop-in hours, employment accommodation services, and instruction on inclusive Web design is also available.

Technical Assistance Project of RESNA
http://www.resna.org/taproject/index.html

RESNA's (Rehabilitation Engineering and Assistive Technology Society of North America) Technical Assistance Project site includes contact information for 56 assistive technology programs in each state and territory. It also contains information on policy changes and emerging initiatives in community living, education, employment, healthcare and telecommunications/information technology. The program also provides access to a library consisting of laws, federal reports and budgets, international reports, congressional hearings, statistics, training materials, and other resources.

Center for Applied Special Technology (CAST)
http://www.cast.org

Furnishes information pertaining to the Universal Design for Learning (UDL), including theories, research, tools, resources, examples, and activities related to UDL. Also available is information on the National Center on Accessing the General Curriculum (established by CAST and the US Department of Education's Office of Special Programs) and descriptions of CAST products such as the Cast eReader and the web based program Bobby. Specialized tours of the site are also accessible.

Closing the Gap
http://www.closingthegap.com/

This site allows access to Closing the Gap's newspaper and a searchable resource directory (published every spring) which highlights a featured product of the week and contact information for supportive organizations.. Closing the Gap also sponsors online forums on the site, which discuss announcements, polls, articles, education and assistive technology practices and strategies, while also making archived discussions available for review.

DO-IT
http://www.washington.edu/doit/

This Washington University site delivers resources on how technology can aid in college and careers for students with disabilities, their advocates, educators and their administrators, in addition to supplying information for K-12 educators. Furthermore, it allows access to information on programs hosted by DO-IT and a link to AccessIT (the National Center on Accessible Information Technology in Education).

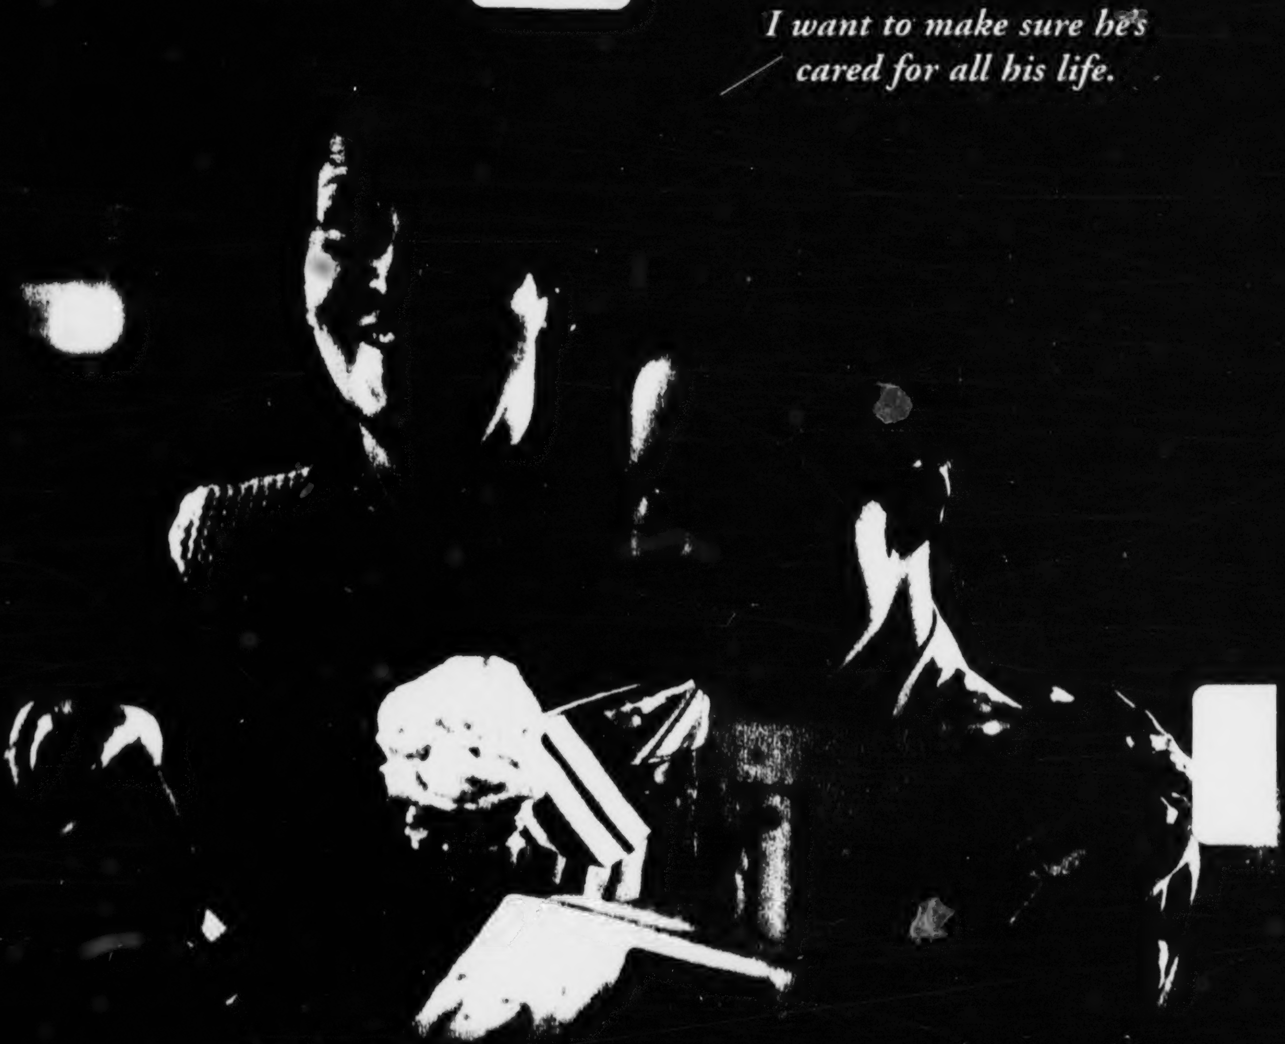
Equal Access to Software and Information (EASI)
http://www.isc.rit.edu/~easi/

EASI provides online training on adaptive technology and how institutions can provide barrier-free computer and information technology systems for persons with disabilities. To aid in this, EASI supplies a "starter kit" for on-line starter kit as well as a web-design kit that provides pointers on designing fully accessible pages. Additional information is available through links to resources in adaptive hardware and software, EASI publications and 13 libraries. The site also includes details on distance learning and legislation and affords online discussions through the EASI network.

The National Center on Accessible Information Technology in Education
http://www.washington.edu/accessit/

This young site (sponsored by the University of Washington and the National Institute on Disability and Rehabilitation Research of the U.S. Department of Education) contains a searchable knowledge base to answer common questions regarding accessible information technology in education. Information on upcoming training activities and events that might be of interest to those who want to learn about or share information about accessible electronic and information technology in education is also provided. Links to case studies and promising practices are also furnished.

There are also hundreds of interactive discussion lists parents can join. Many are organized around different types of disabilities, for example, to share ideas, concerns, and resources with parents of children with hearing impairments, with cerebral palsy or with developmental disabilities. If you have the topic, there is probably a list of people with the same interest out there on the 'Net. For a comprehensive list of Web sites and discussion lists, consult the publication, Disability-Related Resources on the Internet which can be found at http://www.washington.edu/doit/Brochures/DRR/. EP



I want to make sure he's cared for all his life.

I'm Sarah, 43.
My son Jeremy has overcome many obstacles
Financial insecurity shouldn't be one of them.

MetDESK

My husband Bob and I want to make sure Jeremy is provided for when we're not around any more. So we talked to MetLife. Their MetDESK (Division of Estate Planning for Special Kids) specialists helped us with the many financial and legal issues in providing quality lifetime care for Jeremy. Since many of the MetDESK specialists are parents of children with special needs, they're knowledgeable and understand families like mine.

For more information on MetDESK call 1-877-MetDESK (1-877-638-3375). Ask for our brochure *Planning for Your Child with Special Needs* or visit our web site at www.metlife.com/desk.

MANAGEMENT AND CONTROL OF REFRACTORY SEIZURES IN THE MR/DD POPULATION

by Fern R. Potvin, MPA

It has been estimated that almost six million people in the United States have epilepsy and approximately the same number have mental retardation or developmental disabilities (MR/DD). About 25 percent of people with MR/DD also have epilepsy, so it can be assumed that some 1.4 million people have both disorders. Additionally, there is a high level of comorbidity of epilepsy and depression. Yet a significant number of professionals have experience in managing epilepsy, MR/DD or depression only. Moreover, many of the older drugs used to control seizures can have side effects that interfere with cognitive processes and arriving at the right dosage level for both antiepileptic drugs (AEDs) and antidepressants can be a problem.

To ameliorate some of the knowledge gaps, the Exceptional Parent Foundation for Education, Inc. (EPFE), a 501(c)3 non-profit organization, sponsored one-day conferences in January, February and March 2002 in Woodcliff Lake, NJ, Nashville, TN and Los Angeles, CA respectively. Co-sponsors were the Epilepsy Foundation of New Jersey, the Epilepsy Foundation of Southeast Tennessee and the Epilepsy Foundation of Los Angeles, Ventura, San Bernardino and Orange Counties. Designed to offer information on cross-management of these comorbid disorders and provide an update of current therapeutic modalities for epilepsy, the seminar audiences included professionals, parents, families and people with epilepsy and one or both of the other disorders. All three conferences were approved for Continuing Medical Education (CME) credit and for Continuing Education Units (CEUs) in nursing and other medically-related specialties. The conferences were partially underwritten by an unrestricted educational grant from Cyberonics, Inc.

All the seminars followed the same basic curriculum, and the speakers brought their own experiences and viewpoints to bear on their presentations. The faculty roster included neurologists, pediatricians, developmental physicians, epileptologists, a psychiatrist, an internist, parents and community activists.

KEYNOTE SESSIONS

Keynote speakers, renowned neurologists and epileptologists provided an update on neurology in general and epilepsy in particular. They provided an overview of, and commentary on, ongoing research. The history, diagnosis and management of epilepsy were covered, as were types of seizures. The keynotes set the stage for the in-depth presentations that followed.

THERAPEUTIC STRATEGIES FOR REFRACTORY SEIZURES: ANTIEPILEPTIC DRUGS (AEDs)

The use of medication to control seizures has a long history in the United States, as shown in the table below. The table also includes common side effects.

Many people benefit from use of these drugs, either alone (monotherapy) or in combination (polytherapy); the results can be significant abatement of seizures or, occasionally, complete control. Unfortunately, as can be seen from the table, the price of control is almost always sedation, usually resulting in reduced cognitive function. This problem is exacerbated in people with MR/DD.

Attendees at the first seminar in NJ chat with presenter Dr. Russell Joffee during a break.

Moreover, the effects of AEDs diminish over time. This may call for discontinuing a drug and replacing it, or adding a second or third—or sixth or seventh—to the mix. Research has shown that approximately 47 percent of people with epilepsy will be seizure-free with one AED. Adding a second drug will benefit an additional 13 percent, and the seizures of an additional 4 percent will be controlled with the addition of a third AED. Adding still more drugs to the regimen results in almost zero incremental value. Thus, 36 percent of people with epilepsy ultimately do not achieve seizure control with medication, and are said to have refractory, or intractable, seizures.

THERAPEUTIC STRATEGIES FOR REFRACTORY SEIZURES: KETOGENIC DIET, SURGERY

The ketogenic diet can be very effective in children, usually until they are about 6 years old. It is an extremely restrictive regimen of high protein, high fat and very low carbohydrates, and requires absolute compliance. It can be helpful for a limited population for a short time, but is nearly impossible to adhere to for an extended period.

People with epilepsy who are considering surgery must be evaluated to see if they are good candidates for the procedure. First they go through a mapping process, to determine where the centers of epilepsy activity are located within the brain. This may involve electroencephalograms (EEGs), MRI scans, PET scans and the use of electrodes to pinpoint activity. If the person with epilepsy is found to have a localized center of activity, that center can usually be surgically removed and the epilepsy is cured. In the event that activity loci are found throughout the brain, however, surgery is not usually an option.

CHEMICAL NAME	BRAND NAMES	INTRO	SEIZURE TYPE	SIDE EFFECTS
phenobarbital		1912	generalized, partial	sedation
phenytoin	Dilantin	1938	generalized, partial	sedation, dizziness, rash
ethosuximide	Zarontin	1960	childhood absence	sedation
carbamazepine	Tegretol, Trileptal, Carbatrol	1974	partial onset	sedation, dizziness, hepatic damage
clonazepam	Klonopin	1975	adjunct—any type	sedation, tolerance, withdrawal
valproic acid	Depakote, Depakene	1978	generalized	GI, some hepatic failure
felbamate	Felbatol	1993	Lennox-Gastaut; adjunct for generalized, partial	bone-marrow, hepatic failure
gabapentin	Neurontin	1993	adjunct—partial	sedation, drowsiness, dizziness
lamotrigine	Lamictal	1994	generalized, partial	rash, sometimes Stevens-Johnson syndrome
topiramate	Topamax	1996	generalized, partial, Lennox-Gastaut	sedation, somnolence, cognitive dysfunction
tiagabine	Gabitril	1997	adjunct—partial	dizziness, tiredness
levetiracetam	Keppra	1999	adjunct—partial onset	somnolence
zonisamide	Zonegran	2000	adjunct—partial onset	somnolence, renal calculi

In young children, more extensive surgery might be performed. As much as half of the brain can be removed in a procedure called a hemispherectomy and, because of the plasticity of the child's brain, the remainder can take over the functions normally handled by the resected areas.

MENTAL RETARDATION AND DEVELOPMENTAL DISABILITIES

People with MR/DD and epilepsy, their parents and families and the professionals who provide their care and treatment are presented with a dual challenge. Compliance with a drug regimen can be hard to maintain, depending on the person's cognitive limitations. Ability to describe how they feel during or after seizures can be limited not only by cognition but by difficulties in communication. Parents and professionals become frustrated by their inability to control or eliminate the seizures and make the person comfortable; they may also be distressed by their inability to explain what's happening to the person having seizures.

The situation is compounded by the drugs themselves. Sedation, dizziness or somnolence are likely to diminish any individual's ability to function optimally. For a person who has cognitive limitations to begin with, the effect of sedating drugs is multiplied. Early intervention programs and ongoing work have enabled many people with developmental disabilities to achieve at far higher levels than might have originally been expected, but are unlikely to be successful with children who are highly sedated.

The impact of epilepsy on people with MR/DD is far more than seizures, falling or discomfort from non-cognitive side effects, as unpleasant as they all are. The outcome of constant sedation is likely to result in a significant diminution in their ability to learn, to master skills, to stretch and grow and achieve their potential.

DEPRESSION

Depression is a result of biochemical imbalances within the body; it is thought that there is a genetic component to depression, but this has not yet been proven. As much as 20 percent of the US population—56 million people—will have at least one depressive episode during their lives; a smaller number will have recurring or chronic depression. Drugs and talk therapy are both successful treatments for depressive episodes. Ongoing drug therapy for chronic depression, however, is subject to the same trial-and-error process as ongoing drug therapy for epilepsy; ultimately, some people receive no benefit at all from medication and are considered to have chronic refractory depression.

In treating people with depression and epilepsy, the professionals involved must be aware of all medications each person is taking. Interactions between some antidepressants and some antiepileptics can have serious, and sometimes fatal, consequences.

COMMUNITY OUTREACH

People with epilepsy, even those who also have MR/DD and/or depression, do not live in a hermetically-sealed capsule hidden away from the world; they are residents of at least one community and possibly of many. There's the community of actual residence, which might be a residential facility or a group home, the parents' home or an independent apartment or a college dormitory. This is set within the context of the "local community" of the neighborhood or borough or town. There are communities of faith, communities of ethnic and cultural heritage, communities of workers in the same field or the same company, communities of sports fans and opera fans, scrapbookers, stamp collectors, gardeners and golfers. The community-based workers, advocates and parents who spoke at the three conferences described ongoing programs to support people in these different communities, to enhance their awareness of one another and newer, broader ones that would enable them to serve more people.

MANAGING REFRACTORY SEIZURES IN THE MR/DD POPULATION

Each conference explored one additional therapeutic modality for the management of refractory seizures, the Vagal Nerve Stimulator (VNS). This device was approved by the FDA in 1997 and has been implanted in 15,000 people to date. Yet it is still relatively new and gen-

erally unfamiliar to many professionals, people with epilepsy and their families.

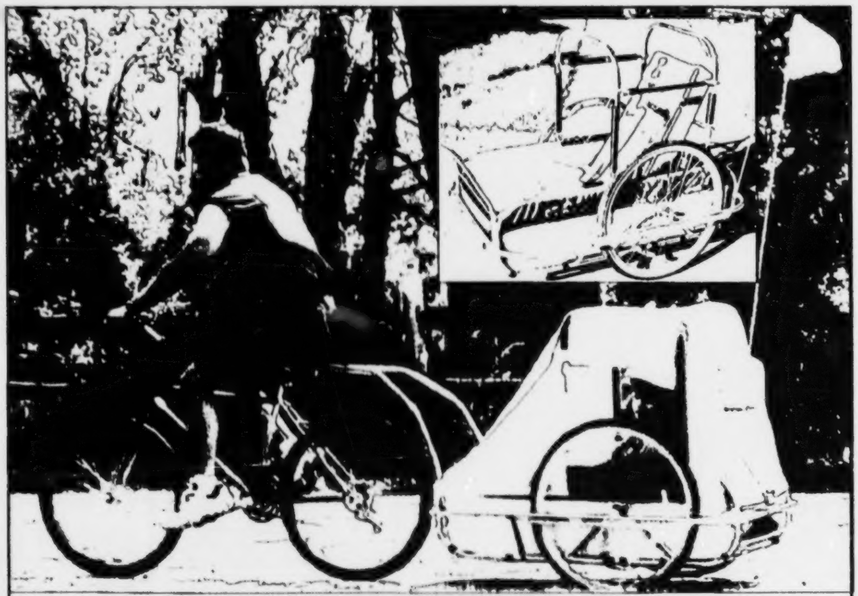
The VNS is similar to a pacemaker. The device is implanted in the chest and wires with electronic stimulators extended under the skin to the left vagus nerve in the neck. The device stimulates the left vagus nerve on a preprogrammed cycle; the stimulation generally reduces the frequency and severity of seizures. Swiping a magnetic wand across the chest over the implant can forestall or interrupt a seizure. Some people with the implant have gone from, for example, 60 seizures a month to one a month; some have become completely seizure-free; others (a small minority) have seen no real improvement and have had the device removed. Many people with the VNS have been able to stop taking any AEDs; others have been able to reduce both the number of different drugs and the dosages.

The predominant side effect of the device is short-term hoarseness. If it continues, the VNS cycle can be readjusted slightly. Some people have not been able to tolerate the feeling of the device cycling, while others have found it to be ineffective. The implant can be removed without long-term effects.

The VNS offers real options for controlling refractory seizures in people with developmental disabilities and has the potential to improve their quality of life significantly. The most obvious is the potential to reduce dramatically the number, strength and duration of their seizures. Second, if they have been taking AEDs that can cause hepatic failure or other potentially fatal consequences, stopping the medication can significantly reduce their long-term risk. Third, and particularly important, they will no longer be subject to the constant sedation and dizziness caused by the drugs. The combination of increased alertness and feeling well physically can allow people with MR/DD to reach their maximum potential in all areas of life.

MANAGING REFRACTORY SEIZURES IN PEOPLE WITH DEPRESSION: INVESTIGATIONAL ONLY

Many people with intractable epilepsy also have chronic refractory depression. Early reports from people in this group indicated that not only had their seizures abated, but



Enjoy the out-of-doors together with a

Satisfaction Guarantee/Lifetime Warranty

their depression had lessened. As the anecdotal evidence increased, several researchers began studies on use of VNS for refractory seizures and depression and on refractory depression alone. Much work is still to be done, but the outcomes seem to be positive and research continues.

All three conferences included an active question-and-answer period, and attendees were particularly pleased to have an opportunity to follow up on points raised during the sessions.

CLOSING REMARKS

Rick Rader, MD, is the director of the Morton J. Kent Habilitation Center at Orange Grove Center in Chattanooga, TN and the editor-in-chief of EP (EXCEPTIONAL PARENT). This is an excerpt from his talk at the end of each conference.

"The effective and definitive treatment of epilepsy has eluded physicians since at least 25 BC, when it was suggested that 'some have freed themselves from such a disease by drinking the hot blood from the cut throat of a gladiator; a miserable aid made tolerable by a malady still more miserable.' Today's generation of AEDs, coupled with Buck Rogers-like implantable brain governors, has given new hope to families impacted by epilepsy and developmental disabilities. The ultimate goal, of course, is in the future: the prevention and cure of epilepsy. There will be no seizures and no side effects for those who have already developed the condition, and dramatic new ways of preventing epilepsy that results from injury, infection, or errors of brain development. Yet these lofty visions are chimeras for the more than one million people who suffer continuing seizures despite the array of treatment options. Coupled with new treatment modalities, the best strategy is still the vigilance and support of parents, families, teachers and direct support professionals."

In summing up the three conferences, Frank J. Murphy, president and CEO of EPFE, noted that, "It was encouraging to see all the enthusiasm on the faces of the parents and families in attendance. The presenters were excellent communicators and offered the attendees much needed new information." EP

Get More Out of Vestibular Stimulation with The Motion Table

The Motion Table enables therapists to deliver the value of vestibular motion to their patients without the need for constant hands-on intervention.

Most stimulation equipment available today reduces the therapeutic effect of *horizontal motion* by incorporating rounding, swinging and tilting motions. **The Motion Table**, through its smooth, "vibra glide" movement provides a steady, uniform stimulation that can help "level out" extremes in patients' behavior.

And, since **The Motion Table** is motorized, patients can be stimulated for longer periods than is possible with manual equipment.

The Motion Table comes in several sizes and is available from RedBarn Enterprises, a leader in innovative solutions for therapists and their patients.

The Motion Table reduces...
- *Hypersensitivity*
- *Self-abuse*
- *Abnormal Muscle Tone*
- *Constipation*
- *Pulmonary Congestion*

The Motion Table increases...
- *Concentration*
- *Attentiveness*
- *Calmness*
- *Body Awareness*
- *Postural Control and Balance*

RedBarn ENTERPRISES

Women and Epilepsy: Breakthrough Seizures

by Cynthia L. Harden, MD

Dear Doctor:
Our daughter has refractory seizures and autism. We have been keeping data on her seizures for the past 10 years, and know that her seizures are more frequent during her times of ovulation and menstruation. We have heard of progesterone therapy for women such as she. Can you give us more information?

Dr. Harden responds:
Yes, you are correct; progesterone has been used to treat seizures that occur relative to the menstrual cycle. Catamenial seizures, also called catamenial epilepsy, occur in about one-third of all women with epilepsy. Women who have refractory complex partial seizures or generalized tonic clonic seizures are most likely to experience catamenial exacerbation, which occurs most commonly at the time of menstruation. Less often, catamenial seizures may arise at the time of ovulation or may last from ovulation to the beginning of menstruation.

In laboratory research, progesterone, in both its natural form and synthetically made (medroxyprogesterone), has strong antiseizure properties. The metabolites of natural progesterone have powerful effects on enhancing gamma-amino-butyric acid (GABA) activity in the brain. GABA is an inhibitory neurotransmitter and therefore increasing its activity would be expected to decrease the likelihood of seizures.

Progesterone, when used in women with epilepsy to prevent seizures, must be considered a complementary and unproven treatment, used only in combination with standard antiseizure treatments. It does not appear to be a powerful-enough treatment to be used alone. Further, it must be kept in mind that hormonal changes only influence seizure occurrence, and menstrual hormonal cycling is not the underlying cause of seizures. Whether using a hormone such as progesterone can prevent these hormonally-influenced seizures remains to be proven.

At this time, the National Institutes of Health has sponsored the first clinical trial of this complementary treatment for epilepsy, using natural progesterone to treat seizures in women with epilepsy. It is underway at the Harvard Neuroendocrine Unit of Beth Israel Deaconess Medical Center, Boston; Weill Cornell Medical Center, New York City; Thomas Jefferson Medical Center, Philadelphia; and Emory University School of Medicine, Atlanta. In the study, natural progesterone is used as it has been in previous small clinical trials, taken three times a day during the second half of the menstrual cycle (luteal phase), from ovulation until the onset of menses. In clinical practice, the prescription form of natural progesterone called Prometrium™ is used at fairly high doses during the luteal phase, as additional therapy to standard antiseizure treatments.

This intermittent method requires that menses are fairly regular, so the starting date of progesterone therapy can be scheduled. Natural progesterone is tapered off over 2 to 3 days after menses start, not stopped abruptly. Some women experience an improvement in their catamenial seizures with this approach. Side effects can include sedation, fatigue, irritability, depressed mood, breast tenderness and premature onset of menstrual bleeding if progesterone is begun too early in the cycle. A gynecologist should be consulted prior to starting progesterone treatment to ensure that hormonal use is safe for the individual.

Synthetic progesterone in the form of Depo-Provera™ has also been used with some success, given at higher doses than those used for birth control. The beneficial effect on seizures with Depo-Provera is most striking if it blocks menstrual cycling altogether. Therefore, Depo-Provera as a treatment for epilepsy also requires the guidance of a gynecologist as well as a neurologist.

Progesterone is a potentially beneficial complementary treatment for seizure disorders in women who have seizure exacerbations in relationship to their menstrual cycles. Its exact benefit remains to be proven and is currently under evaluation. The neurologist and gynecologist should both be involved when progesterone is used for women with epilepsy. EP

Cynthia L. Harden, MD, is Associate Professor of Neurology and Neuroscience and Associate Attending in Neurology at the Weill Medical College of Cornell University in New York, NY. Dr. Harden is a member of several professional societies including the American Epilepsy Society and the American Academy of Neurology, where she is an officer in the Epilepsy Section. She chairs two committees of the American Epilepsy Society: the Task Force for Women with Epilepsy and the Focus Group for Women Working in Epilepsy. She has received numerous honors and awards and has been a speaker at more than 60 symposia and invited lectures.

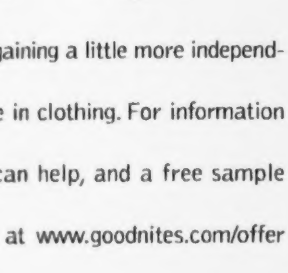
WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing, can, even in a small way, change a child's way of life.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*



Pull-Ups
GoodNites
DISPOSABLE ABSORBENT UNDERPANTS

NO EXCUSE FOR FAILURE: BILL PORTER, ROLE MODEL

By Joseph M. Valenzano, Jr. and
Natalie Gerber, PhD

An American Hero

By Joseph M. Valenzano, Jr.

Many years ago, I was fortunate to hear Jim Valvano, the late great North Carolina State University basketball coach, deliver a stirring speech that wasn't just another sports tale but a profound lesson about life. Coach Valvano had just led his NC State team to the pinnacle—the championship of the NCAA Tournament. It was arguably the greatest upset victory ever in the history of collegiate basketball.

Coach Valvano talked extensively about his mother and father and how much they meant to him. The coach ended his talk by telling a poignant story. One day, after winning the championship, Jim noticed a suitcase by the bed in his father's room. When he asked him about it, his father explained that his bags were packed and he was ready to go to the next championship game his son coached. Jim Valvano laughed and told him, "Dad, it's hard to do." His father responded, "I know. But you will do it. My bags are packed."

Coach Valvano reflected on what his father said; his father had given him perhaps the greatest gift he ever received. Despite his shortcomings and failures, his father always believed in him. Believing in someone instills a quality of imagination, a sense of courage over timidity that propels people, ordinary people, to accomplish extraordinary things.

Bill Porter and Shelly Brady

On July 14th at 8pm, Turner Broadcasting System will broadcast nationally the TNT original film, *Door to Door*, which tells the story of Bill Porter. Bill is an Oregonian from Portland who became a top-selling salesperson for Watkins Products, the manufacturers of home and personal care goods. Back in 1961, when Bill began his 40-plus-year association with the company, Watkins products were sold door to door. In those days, salespeople like Bill strove to sell $1,000 a month, which would earn them entry into the coveted Watkins $1,000 Club. Within seven months on the job, Bill parleyed his natural passion for sales (his father Ernest was

On occasion we come across a personal story so powerful that we remark on how "life imitates art." But it is very rare for art to depict accurately the lives of people who have disabilities with appropriate portrayals, passion and dignity. Mitch Albom did this admirably in his book *Tuesdays With Morrie*. Maria Shriver accomplished it in her book *Ten Things I Wished I Learned*. This summer our nation will be treated to a book and movie that take these concepts and go one step better.

The book, authored by Shelly Brady, is called *Ten Things I Learned from Bill Porter*. The movie based on the book, entitled *Door to Door*, is a Turner Broadcasting Production starring Academy Award nominee William H. Macy.

I had the privilege of interviewing Shelly and I can tell you that she is a woman of enormous dignity, faith and talent. She is also a devoted mother of six and the kind of friend each of us can only hope to have in our lifetime. Her book captures not only the essence of what it is like to live with a disability but how to succeed and prosper in spite of it. I doubt there was ever a clearer example of how to adapt, improvise and overcome obstacles than Shelly's heart-wrenching depiction of her friend and employer, Bill Porter, a real American hero.

Bill Porter, a man with cerebral palsy, became a door-to-door salesperson. Not just a good salesperson, but one of the best. His life was shaped and nurtured by the resolve, dedication, faith and iron will of his mother, Irene, who—despite the "best medical advice of her time"—simply believed in her beautiful little boy. If she ever had any thoughts about "why did this happen to me?" or "why my little Bill?" my bet is they were only fleeting. She knew there were more important things to do.

She had to get on with the task of being an exceptional parent. She had to help Bill understand that he could achieve anything, that she believed in him and that he needed to believe in himself as well!

I asked Shelly for the best example of Bill's perseverance in the face of overwhelming odds. She told me about the time Bill was out making sales calls during a major ice storm. The storm became so bad that the bus lines Bill relied on for transportation suspended service. He had to hitch a ride home, only to find that the ice was so thick he couldn't walk up his driveway. Instead, he got on his hands and knees and crawled to his front door. When Shelly asked, "Bill, are you crazy going out in a storm like this?" Bill quietly responded, "It's the best time to sell; more people are home at this time."

For those who may ask why God created a boy with all those "imperfections," the answer given in the book is really quite simple. It is because the world.... all of us... needs Bill Porter. We need him to teach us to look at the person first, the disability second, because when you do that, anything is possible. We need Bill Porter to provide us with yet another shining example of what can be done, what can be achieved if we believe in each other.

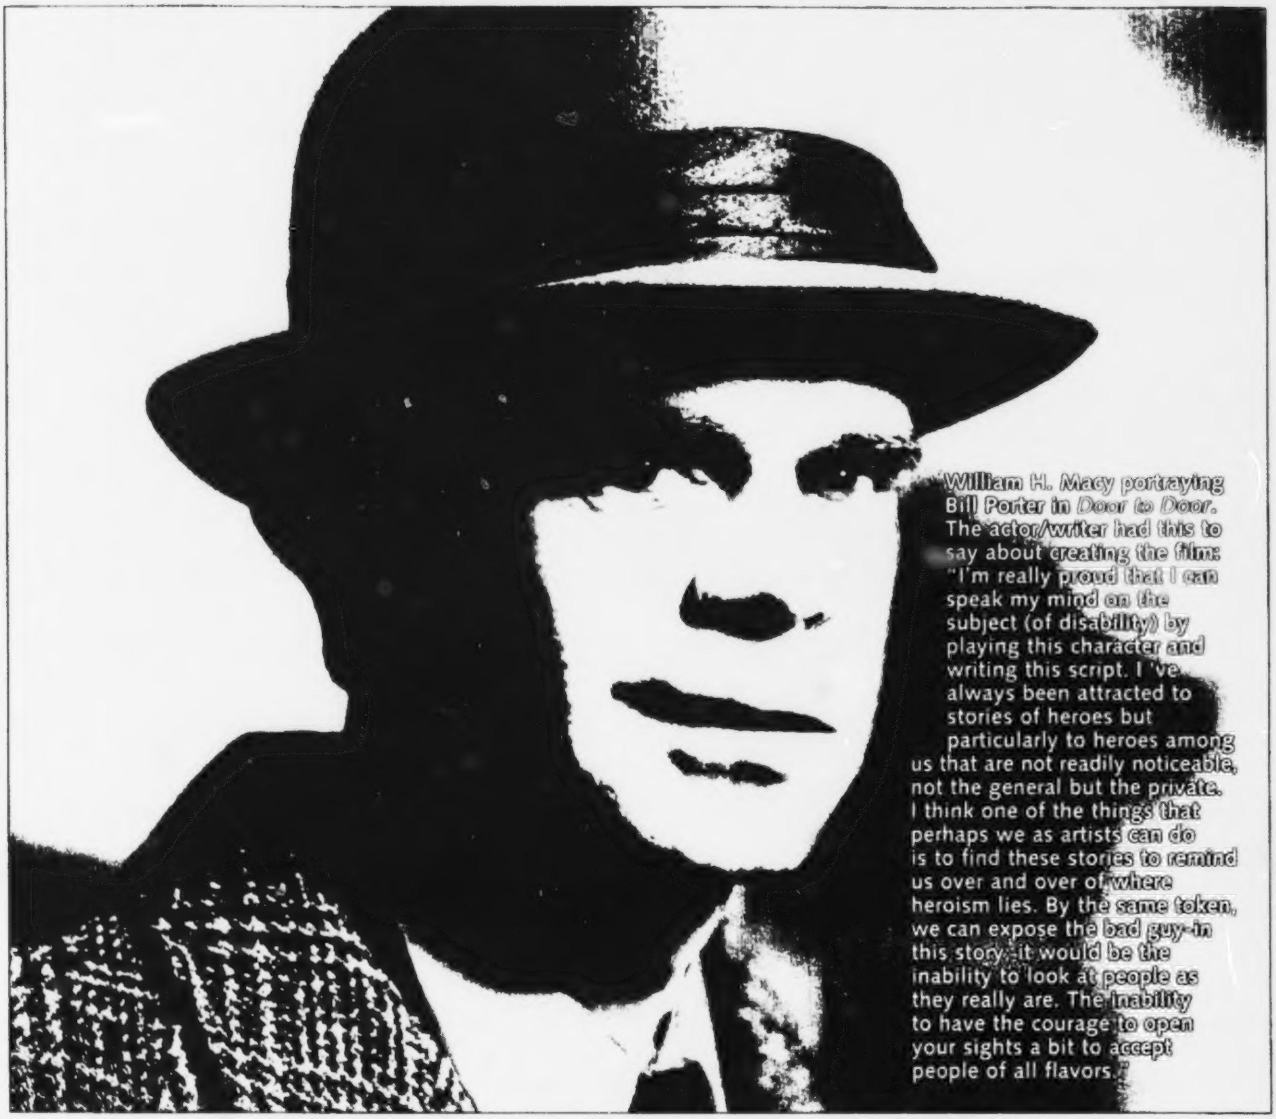
Thank you, Bill. Thank you, Shelly. God bless.

also a salesperson), his positive attitude and his belief in the money-back-guaranteed products he sold into a successful bid for membership in this club. For any young salesperson, such a sudden rise to success would be meteoric. But when you consider that Bill also has cerebral palsy—and had to prove that he was able to do his job, first by accepting the worst territory in Portland and then by working strictly on commission—his success story becomes nothing short of miraculous.

Yet Bill would be the last person to characterize his success in this way. He attributes it instead to his determination to see all situations as sales opportunities. Even when his body ached from seven to ten miles of walking

Bill Porter working on his correspondence

continued on page 66



William H. Macy portraying Bill Porter in *Door to Door*. The actor/writer had this to say about creating the film: "I'm really proud that I can speak my mind on the subject (of disability) by playing this character and writing this script. I 've always been attracted to stories of heroes but particularly to heroes among us that are not readily noticeable, not the general but the private. I think one of the things that perhaps we as artists can do is to find these stories to remind us over and over of where heroism lies. By the same token, we can expose the bad guy-in this story-it would be the inability to look at people as they really are. The inability to have the courage to open your sights a bit to accept people of all flavors."

"Every door that slammed in his face was a door he knew he would someday open."

continued from page 65

a day, Bill says, "motivation...and a responsibility to the customers kept me going. If a door slammed, then I tried a little harder at the next door to persuade them to hear me out!"

Actor William H. Macy, who co-wrote the script for *Door to Door* and stars as Bill Porter, characterizes Bill as an extraordinary person whose stoicism and sense of humor made him a consummate salesperson. As Macy comments, "Bill is a successful salesperson. That's hard to do even if you don't have cerebral palsy. It's rough to do, and he succeeded wildly. He stayed his own man all through his life."

Bill's former delivery assistant and now business partner, Shelly Brady, has portrayed Bill's incredible perseverance in her new book, *Ten Things I Learned from Bill Porter* (New World Library, June 2002); its release roughly coincides with the TNT film broadcast. As she recounts, Bill's success derives from his incredible persistence and perseverance. "Where you or I might be discouraged by a simple 'no,' Bill always heard an eventual 'yes.' Every door that slammed in his face was a door he knew he would someday open."

One telling anecdote in the book captures what truly makes Bill a standout. Several years ago, Bill and Shelly were flying to a speaking

Johnny, 51 lbs. and 48" tall, in the Columbia Car Seat
Sharing the Caring

Columbia offers you solutions to the daily challenges of transporting, bathing and toileting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

■ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! It has been the No. 1 choice since 1986, for its adjustability and stylish comfort.

#2000 Car Seat

■ At bathtime, our popular **Reclining Chairs** and **Wrap-Around Bath Supports** allow your child – and you – to enjoy the bath.

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

#7700 Hi-Back Wrap-Around Support

■ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

Why do these products work so well? Columbia products are thoughtfully designed, with each item available in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, tested and proven in real-life experience. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

#4200 Small Support for children

Helen Mirren and William H. Macy appear as Irene Porter and her son Bill in *Door to Door*, Airing 8 pm EDT July 14th on TNT

continued from page 66

engagement at a sales meeting, something they have done often in the past few years, as many corporations worldwide have asked them to be motivational speakers. But Bill, who had never flown before, did not have a picture ID and was not permitted to board the plane. Shelly and Bill decided to make a quick side trip to the Department of Motor Vehicles, where a friendly DMV worker recognized Bill and quickly—and somewhat liberally—processed an ID for him. While Shelly organized paperwork and felt frazzled, Bill sold his new friend a can of Watkins cinnamon.

It is this ability to turn disappointing circumstances into sales opportunities that has made Bill the top-selling Watkins salesperson in Oregon and the Northwest Region, and among their top ten salespeople in the US. As Shelly says in the book, "Bill Porter is a perfect example of an individual succeeding because he stayed focused on something he felt passionate about."

Remarkably, Bill Porter sees himself as an ordinary person doing a job in order to pay the rent. When asked if he ever thought of himself as a role model, Bill Porter nonchalantly replies, "It didn't really ever cross my mind. I

The Ten Lessons

In *Ten Things I Have Learned From Bill Porter*, Shelly has shared the blessings that she and her family have received from knowing Bill. The book summarizes these in 10 basic points:

1. Follow your passion.
2. It doesn't matter how you got here, only where you're going.
3. Mother knows best.
4. Persistence pays off.
5. Don't take "No" for an answer.
6. Know your limits and reach beyond them.
7. Be a team player.
8. If it isn't broken, don't fix it.
9. There are no obstacles.
10. Live your values.

Ten Things I Learned from
SHELLY BRADY

just went about my everyday job." That everyday job, sales, is recognized as one of the most difficult professions in which to achieve success. Regardless, Bill was never uncertain in his ability. "It's the one thing I felt I could do—no, I knew I could do it!"

Bill credits his mother, Irene, for building confidence in him. "Mom told me I could do anything I set my mind to do. I knew she was behind me all the way. No matter what problems or handicaps you have, you have to go ahead and do your job."

Though he may see nothing extraordinary in his life, others disagree. William H. Macy was drawn to Bill Porter's determination and extraordinary selling ability after viewing ABC's powerful *20/20* program segment about Bill's life, which generated the highest viewer response in the show's history. "One must just stop and imag-

continued on page 70

from Chapter 5:

"Don't Take 'No' for an Answer"

"According to the Merriam-Webster Dictionary, the word 'no' is an act or instance of refusing or denying something. For instance, a customer's refusal to purchase goods or services from a salesperson is generally expressed via the word 'No.' For some reason or another, Bill Porter doesn't hear it that way! Bill hears the word 'no' differently; he hears it to mean that the customer will be glad for Bill to return at a more convenient time or pleased to be shown another, more necessary product...

I learned from Bill Porter that when someone says 'no' they are simply asking you to modify your proposal or change your delivery. I believe that Bill's attitude toward the word 'no' and his ability to not focus on the 'negative' are traits that many people admire in him.

Some have interpreted Bill's cerebral palsy as one gigantic 'No' dished out by the heavens, but he never looked at it that way... When he could have collected disability or at least taken a job that wasn't so mentally and physically demanding, Bill chose instead a profession—door-to-door sales—that challenged his so-called 'handicap.'"

What Makes Bill Porter So Special?

EP President, Publisher and CEO Joe Valenzano, Jr. (JV) spoke with Shelly Brady (SB) about Bill Porter's business success and his influence on her life. The interview took place on April 26, 2002 at the United Cerebral Palsy annual national conference in Minneapolis, MN.

JV: How has your view of people with disabilities been shaped by your relationship with Bill Porter?

SB: Knowing Bill has been such a blessing in my life and the life of my family. I was taught from an early age to look beyond outward appearances. My relationship with my friend Bill has been a constant reminder that, no matter what, we are all part of the human family. We may come in different shapes and sizes, different colors, rich or poor, from here or from there...and we may be differently-abled, but we are all brothers and sisters.

JV: Have you ever felt that Bill's disability influenced your relationship?

SB: Not at all. From day one, Bill was my boss. I respected him as my boss....I did see a customer here and there who would come to me and tell me that they purchased something they just didn't need because they wanted to help this "disabled" man and then they would ask me to tell Bill not to come to their house anymore. I would just reply, "It wouldn't matter if I told him not to come to your door. He'll come anyway, and so you had better figure out how to say no. Good luck! And I'll probably see you next time when I deliver your next order!" To me, Bill is not a man with a disability. Bill is, well, Bill!

When I was in high school I thought it was so cool that I worked for a man who had some sort of 'handicap' (I didn't know at the time that he had CP), yet he was so successful. I really respected him as my boss. I have had quiet moments, after kissing my six children goodnight and tucking them in, when I have felt bad that Bill never experienced marriage or the joy of being a parent. Then, when they are screaming and at each other's throats, I've just felt sorry for myself!

JV: What lesson has Bill taught your children?

SB: The lesson is that we are all people, all part of this human family, ,and we all need a friend. We need to look beyond our obvious differences to find out what we have in common...Bill has [also] taught them a great deal about valuing work. For several years, my entire family helped to deliver Bill's Watkins products. We saved the money we earned from Bill, and it helped pay for a family trip to Disneyland.

JV: Has knowing Bill had an impact upon your parenting?

SB: I look at how great Bill turned out, and I hear how often he tells me his mother had the greatest influence on his life. I know I want my children to grow up and be such wonderful adults and contribute to society the way Bill has.

JV: Your daughter Katrina has PVNS (pigmented villanodular synovitis, a rare disease that is a recurring benign tumor within the knee joint, causing severe pain and limited mobility). How has your experience as a parent coping with her disability been affected by your relationship with Bill?

SB: It has given me a newfound respect for him and his mother. Our relationship with Bill and some of the new friends we have met at Shriners Childrens Hospital, where Katrina has had three of her five surgeries (and is on the wait list for her sixth), helps to keep things in perspective. Bill is so concerned about Katrina's health and her illness. He can't imagine going through what she is...Of course, we can't imagine going through the obstacles that he has...We are able to keep our perspective and have an appreciation for our own trials.

continued from page 69

ine for a second, hearing a knock at your door, opening it up and having this fellow talk to you," Macy says. "And when the day is done, he sold you $40 worth of stuff. It is not an easy job," he adds. "He just does not think that what he has done with his life is extraordinary, and I most respectfully disagree with that."

Bill takes in stride all of the new attention that the *20/20* segment and now the book and the movie have produced. While he does not seek publicity for himself, he knows better than to turn down an opportunity for sales to new friends and customers. (The end of the movie plugs his Web site, http://www.billporter.com, on which he continues to sell Watkins home and personal care products.) Yet while all the attention has brought him

BEST COPY AVAILABLE

some new financial stability and allowed him to pay off the hospital bills incurred when he was struck by a bus in 1997 (ending his door-to-door sales career), his hopes for the film are directed toward others. "I hope the movie and the book will inspire a lot of people to make the most of their ability," he says.

In particular, Bill is glad that the film has proven so inspirational to the United Cerebral Palsy Foundation (UCP), with whom his mother Irene was deeply involved, and whose products first launched his own sales career. He is enthusiastic about the prerelease screening events that nationwide UCP chapters are hosting and hopes that they will encourage others the way that the UCP once encouraged him and his family. "UCP was a big support for my family when I was first starting out as a salesman," he says, adding thoughtfully, "I feel as though it helped me become independent. I am so glad that, in a small way, I can give back by sharing my story and being involved today. I hope that my story can encourage others and offer support to others the way UCP was there for my family."

"UCP is proud to be associated with *Door to Door*, and celebrates the triumph of the human spirit with the cast and crew," says Paul T. Burke, UCP's director of marketing and communications. "The film reflects an individual's right to work, advocates for full citizenship and honors the true essence of the Americans with Disabilities Act."

Bill has his own words of encouragement for any young person with a disability seeking the dignity of a job and a regular paycheck. "Keep on trying," he says. "Opportunities will come eventually, as they did for me." His words are evidence of the patience and perseverance that have made him such a success in business. "People change their minds when they fully understand," he adds. "Never give up!" EP

Door to Door airs on TNT on July 14th at 8pm EDT (check local listings for the exact time in your area). The all-star cast includes Academy Award nominees William H. Macy (as Bill Porter) and Helen Mirren (as Irene Porter), and Emmy Award-winner Kathy Baker. The script was co-written by Macy and Steven Schachter, who also directs. An estimated 20 million people nationwide are expected to tune in for the broadcast.

Check with your local UCP chapter to see if they are hosting a launch event for the film during June.

Exceptional children deserve exceptional care.

The best help for cerebral palsy, spina bifida and related disorders is at Kennedy Krieger Institute.

For 61 years, Kennedy Krieger Institute has been the leader in helping children with severe disabilities. Focusing on early identification, intervention and treatment, our state-of-the-art interdisciplinary team approach—combined with a caring, supportive touch—has enabled generations of children to live their lives to the fullest.

Our comprehensive assessment and treatment for children with cerebral palsy, spina bifida and related disorders includes: Neurology, Medical Services, Nursing, Urology, Orthopedics, Physical Therapy, Occupational Therapy, Orthotist, Clinical Psychology, Neuro-Psychology, Seating, Feeding, as well as Rhizotomy, Spasticity and Movement Disorder clinics.

And unlike many programs, we see patients beyond age 18. Call Kennedy Krieger Institute today. We're here to help.

VERMONT PARENT DOCTOR TEAM DESIGNS A MEDICAL HOME FOR CHILDREN WITH SPECIAL HEALTHCARE NEEDS

by Elizabeth Wehr

When parents of children with special needs arrive for office visits at Gifford Pediatrics, in Randolph, Vermont, they receive a simple, one-page questionnaire about their immediate concerns. (See below.) Parents can check off any of a dozen possible items, ranging from their child's height and weight to loneliness, falling behind in school and making and keeping friends. Parents can also write in other concerns, and they are specifically asked to indicate which two are "most on their mind today." For parent Kim Daniels the form is a welcome invitation from her son's pediatrician, Dr. Louis DiNicola, to talk with him about "the things that are on my mind—not just medicine and tests."

The questionnaire and other special features of the Randolph, Vermont practice are also meant to help parents obtain other community resources and connect to other families and professionals. For example, the questionnaire asks parents whether having a care coordinator could help in getting their child's needs met. It also asks whether they would like to be contacted about financial resources and family support by the state's Parent to Parent organization. Betsy Hannah, the nurse and care coordinator at the Gifford practice, often helps parents complete the form. If they wish, she sits in while parents discuss their concerns with their children's doctor and then she follows up later.

The questionnaire, the care coordination and an informal parents' network are designed to make the practice a "medical home" for children with special healthcare needs. Some special features are meant to minimize potential problems in office visits. Kim Daniels reports that the entire office staff knows that spending time in the waiting room is too challenging for her son, Troy, although another child "can get through any visit – so long as there's a blue balloon" waiting for him. If necessary, the staff may schedule a senior volunteer to park a family's car.

Other special services of the Gifford practice go well beyond dispensing balloons, valet parking and medical services. Parents call Betsy Hannah for help with school problems, parent contacts and, sometimes, just to talk about feeling overwhelmed by their child's needs. She also can put them in touch with a resource parent, who helps them qualify their children for SSI (Supplemental Security Income), Medicaid, personal care assistance and other forms of aid. Dr. DiNicola meets monthly with interested parents to talk about such topics as ADHD and adolescent transitions. Parents trade equipment and experiences among themselves.

For parents, the practice has evolved into a single point of entry, a term referring to the idea of one identifiable place in a community where parents can learn about and gain access to the bewildering array of health services and therapies, financing options, special equipment, early interventions, special

Gifford Pediatrics
TODAY'S CONCERNS

1. Do you have any concerns about the following issues for your child?

( ) height and weight
( ) development
( ) ability to learn
( ) falling behind in school
( ) sleeping
( ) loneliness
( ) behavior
( ) being independent
( ) learning self-care skills
( ) the future
( ) making and keeping friends
( ) participation in activities
( ) other(s)____________

2. Of the above concerns what are the two most on your mind today?

1.________________ 2.________________

3. Would having a care coordinator available help you with getting your child's needs meet?

4. Could someone contact you from Parent to Parent of VT regarding resource financial opportunities and family support.

THANK YOU !

education classes and social supports that their children may need as they grow up.

The medical home design team. Ten years ago, the American Academy of Pediatrics (AAP) adopted a "medical home" policy recommending that a child's physician be responsible for all aspects of a child's healthcare, including "interaction with school and community agencies to be certain that special health needs of the individual child are addressed." Working with the AAP and the national parents' organization, Family Voices, the federal Maternal and Child Health Bureau (MCHB), its state offices and grantees are developing materials and testing methods for putting medical home principles into practice.

Dr. Louis DiNicola and Nurse Betsy Hannah with two of their patients, Calub Collins and Jessica Russell.

What is interesting about Gifford Pediatrics is that Dr. DiNicola and his office staff have worked with Kim Daniels and other parents to translate the medical home concept into a reality. The catalyst for this process was the Lebanon, New Hampshire Center for Medical Home Improvement, which receives MCHB and other grant support. Center co-directors Jeanne W. McAllister and Dr. W. Clark Cooley provided start-up technical assistance to Gifford Pediatrics and three other practices in Vermont and New Hampshire. They are now working with thirteen additional practices.

To receive technical assistance from the Center staff, a physician must agree to work together with his office staff and with the parents of children with special needs. Doctors must also commit the time needed to work together with the team. The Center allows each individual practice's team to define their priorities and decide how to address them. According to both the Center and the Gifford practice team, medical home improvements can only alter a medical practice if the team itself dreams and owns the improvements. The role of the Center's staff is to support these processes, by facilitating meetings, providing information and otherwise helping teams realize their goals.

As they work with practice teams, the Center staff also develops and tests methods for identifying children with special needs, survey instruments for physician practices and other "do-it-yourself" materials for physicians and interested parties. The Center characterizes its materials as "tools" that serve to improve the process of care in medical practices by relying heavily on families' insights. In fact, a Medical Home Improvement Kit published electronically by the Center warns that its tools "won't work without engaging parents of children with special needs as partners in the process of...improving care."

Steps in designing a medical home. Like any home, the medical version must be built one step at a time. The first, and most important, step is to determine whether a physician would be comfortable with the team process and with the goals that emerged in the Gifford practice. As Dr. DiNicola says, a physician must have a professional commitment to including highly challenging children in his or her practice. Long before he became involved with the medical home project, Dr. DiNicola was participating in an informal network of northern New England pediatricians who wanted to apply their professional training to children with special needs, instead of routinely referring them to major medical centers.

A physician must also be interested in working with parents as partners, not only in the care of their children but in evaluating and improving his or her practice as well. Everyone involved with the Gifford practice team advises parents and doctors to start with small steps and let ideas emerge over time. For example, as Center researchers were surveying the practice, the practice team began to consider how information about the needs of individual children could be incorporated into day-to-day office routines. One result was the "Today's Concerns" questionnaire. Another was a short script, worked out with the office receptionist, so that she would remember to ask about special needs when a parent called to schedule a child's office visit. Then the team created a two-page "Medical Care Plan" form to supplement a child's medical record. The form provides "at-a-glance" information—everything from a child's medications, devices and specialized services to his or her nickname and unique family needs/assets. When a child's primary care doctor isn't available, the form enables the treating physician to know, for example, that a child cannot tolerate the use of a tongue depressor. The

continued from page 73

Center's technical assistance was essential for some of the accomplishments of the Gifford practice. For instance, the care coordination that Betsy Hannah provides is now financed by the state's Medicaid program. Data collected and analyzed by Center researchers in collaboration with a managed care organization showed that care coordination saved money because it lowered rates of emergency room and hospital admissions for children with special needs.

Technical assistance also helped the Gifford practice team when it approached local school officials about ensuring that children received the therapies at school that Dr. DiNicola prescribed. At the first meeting, a professional facilitator kept conflicting priorities from stalemating discussions among the parents, healthcare professionals and school officials. Ultimately, all parties collaborated to develop a unified form that includes medical information for schools, school information for the physician and parents' preferences. The form also helps structure periodic meetings where parents, teachers, school officials, Dr. DiNicola, Betsy Hannah and others discuss a child's individual needs. (A modified version of this four-page form appears on pages 75-77; the Comments page has been omitted due to space limitations.

No one finds it easy to change familiar routines that reflect their experiences and education or training. Given their direct responsibilities for the health and wellbeing of patients—and the demands on doctors' time, it may be especially difficult for physicians to contemplate either the process or the results of designing a multipurpose medical home for children with special healthcare needs. But the payoff, according to the team at the Gifford practice, is healthier children and stronger families. "The most important thing," concludes Dr. DiNicola, "is to get the parents involved."

Resources for Exceptional Parents. Two of the forms developed by the Gifford Pediatrics team are reproduced with this article. These could be the basis for beginning discussions among parents; but the team process of developing individualized forms and other strategies is considered important for the success of any new practice.

The Center for Medical Home Improvement, at Children's Hospital at Dartmouth-Hitchcock Medical Center, New Hampshire, publishes its Medical Home Improvement Kit and other materials on its Website, where a video on developing a medical home for children with special healthcare needs may be viewed (http://www.medicalhomeimprovement.org). "Snapshots of Your Life"

by Lori Pedersen

A blue-eyed miracle to behold...
Running across the yard, blond hair blowing in the wind, so happy, so energetic...
Loving and living each moment in time,
Making it all your own.

Sleepily waving your love to me as the tears fall silently down my cheeks and onto the floor...
The door closing to the operating suite as they prepare you for open-heart surgery...
Trusting God for your life.

A new exciting door opens for you...the first day of kindergarten.
Yet, as the year passes, the door closes on hopes... you "just have a speech problem"...
We learn new meanings to the words "mental retardation," "chromosome abnormality,"
"special education"...
"Institutionalize the child."

Fall drifts along year after year and with each new year, your joy of school and learning grows by leaps and bounds. Defiantly struggling to disprove the predictions...
You grasp each new concept and never let it go.

Rachel ready for the Prom

Rachel wearing her Prom Princess crown.

Special Olympics...the time of year you anticipate so greatly, that it constantly fills your thoughts and words. The time of year that you don't have to be afraid of others. The time of year that you can be Rachel and live Rachel and love Rachel for every single thing that makes her unique and priceless.
Your moment in the sun...pure, unblemished joy...too much to contain...

Sunday morning...it's time to go to church...you put on your prettiest dresses and we place ribbons in your hair...
You sing and clap your hands to the wonderful, loving God,
Who has so obviously held you in His arms and carried you throughout your life,
Blessing you, and all of those you touch with your joy of living.
"She'll never read." And yet I sit amazed as you read the fifth-grade book to me...
You read the signs as we drive down the road...the recipe books...letters from our family...
You are reading.

EP selects "parent editorials" for the purpose of providing a forum for emerging opinions and evolving parenting philosophies. EP also welcomes responses to previous editorials that represent divergent views. These select editorials do not necessarily reflect the opinion of EP. — Rick Rader, MD, Editor-in-Chief

The same operating suite...and more tears..."Spinal Fusion...Scoliosis is crippling her...Possibility of a wheelchair if we don't proceed"...Several hours, Pediatric ICU, Orthopedic floor, upper body brace...You come home...you can't get up without your brace...

I roll you, brace you, powder you, dress you, bathe you; from June through October...

The brace is removed and you now have the figure of a woman.

Where did that come from?

Hello Junior High...Goodbye Miss Meyer...how we do love you...junior high, a success...You love school.

You're a student council rep for your grades...you take Home Ec...more Special Olympics...Chorus with Mr. Jackson... concerts...the big trip to Jefferson City with the student council and Grandpa gets to go with you on the 'luxury bus'...Christian Alliance...lock-ins...dances...

"Mom, a boy SLOW-DANCED with me"...Eighth-grade Graduation.

Rachel walking in at high school graduation

Grandma Nana, Emily, me, and you...shopping for two hours to find you the right dress...Grandpa dropping off your corsage...ordering your graduation cake...getting seats four rows from the front row...hearing the music and seeing you walk to your seat, with your classmates; so proud of the difficult, nearly impossible road that you've walked to earn that diploma...tears fighting their way down my cheeks as I recall each of these snapshots and see you know...I am so incredibly proud of you and want to tell everyone, THIS is MY beautiful daughter...and to tell the people, who are so quick to hand out the label, "mentally retarded", cloaked with its chains and bondage and shame...that they could give it wings of hope...for they are just two words...two...words. Words that should not hide the beauty of the soul of those that they speak of, but two words that should shine an illuminating light on the pathway of experiencing just such a relationship with these that God created and loves. **EP**

Lori Pedersen of Pevely, MO, wrote this poem for her daughter, Rachel, on the occasion of her junior high school graduation in May 1997. Rachel endured a number of disabilities, including mental retardation, attention deficit/ hyperactivity disorder, a heart defect, scoliosis and a number of other extensive problems requiring multiple surgeries. The final stanza was added when Rachel graduated high school last June. The accompanying pictures show Rachel at her high school graduation and as the first-ever Herculaneum High School Prom Princess elected by her senior class. She received a "School Spirit" award her senior year, in part for her work as basketball manager for the boys and girls varsity basketball teams. Sadly, Rachel passed away suddenly on November 11, 2001. Though Pevely is a small town, more than 1,000 people turned out for her visitation and funeral. At her class's request, Herculaneum High has established an award plaque that bears her name; each year, a student will be honored as receiving the Rachel Pedersen School Spirit Award.

Lori Pedersen works as a Site Supervisor for a day rehabilitation support service program for adults with developmental disabilities at Developmental Services of Jefferson County, MO.

Parents may send their submissions for Parent Perspective to Exceptional Parent Magazine, 65 E. Route 4, River Edge, NJ 07661; e-mail: epedit@aol.com

SPORT CORNER
NDSA

ON TRACK WITH TRACK AND FIELD SPORTS

by Carol Keller, PT

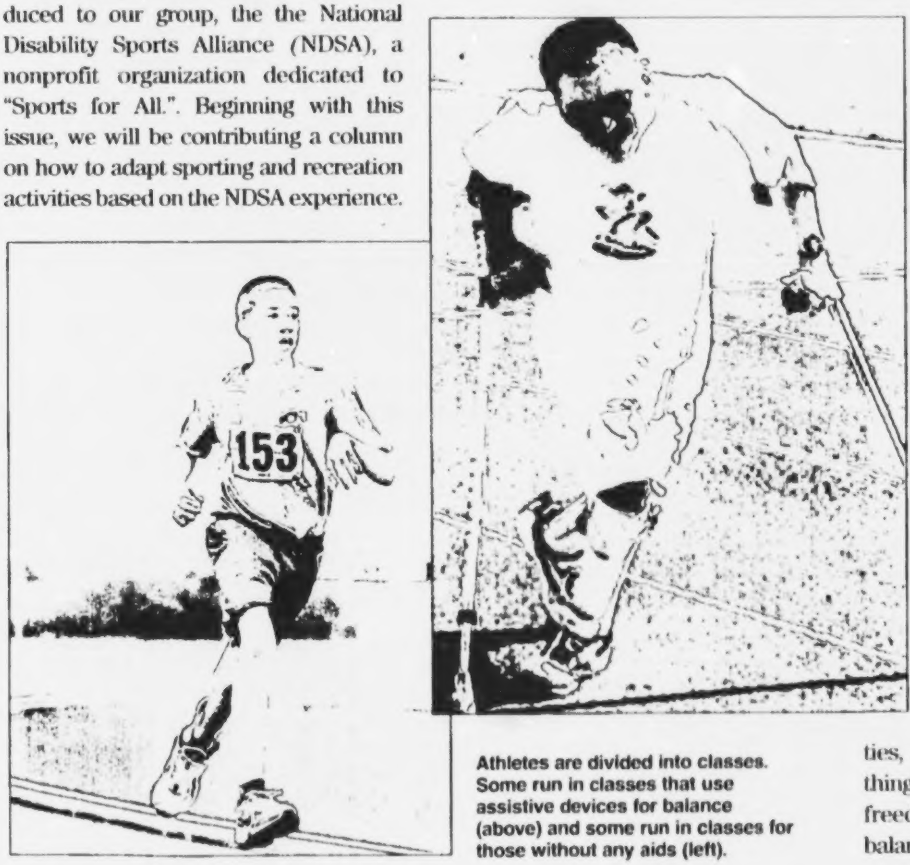
EP is proud to *PRESENT THE FIRST OF NDSA'S ONGOING COLUMN DISCUSSING INCLUSIVE AND COMPETITIVE SPORTS AS WELL AS RECREATION ACTIVITIES. —THE EDITORS*

Last month, EP's readers were introduced to our group, the the National Disability Sports Alliance (NDSA), a nonprofit organization dedicated to "Sports for All.". Beginning with this issue, we will be contributing a column on how to adapt sporting and recreation activities based on the NDSA experience.

We thought it would be appropriate to start this series by describing a sport that is relatively simple to coordinate for parents and others who wish to begin their own adaptive sports program: track and field activities. With these activities, it doesn't matter if you only have a few participants—one athlete can even practice alone, although it is not as much fun as having teammates. Another advantage is that the events don't have many complicated rules to learn.

Some NDSA track and field events are the same as those typically associated with the sport, such as the 100, 200 and 400 meter races and do not require any modification. But there are also specialized events. For the younger athletes in the junior division, the distances offered include 20 and 60 meters. There is a "weave" event for power chair users which requires the athlete to move down the track, zigzagging between cones. All wheelchair classes may compete in the slalom. (See picture.) The slalom is an obstacle course requiring attention to the course and control of the wheelchair's movement.

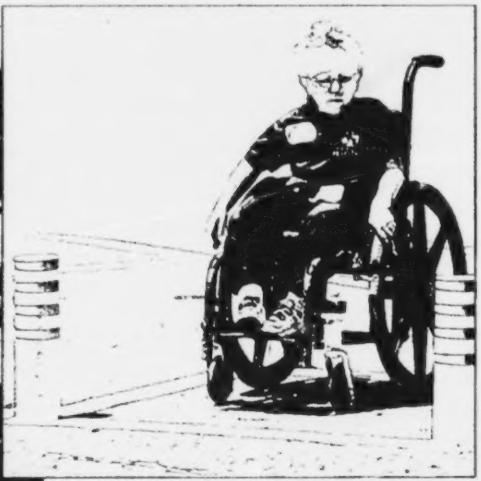
In all track events, athletes compete against others who have been placed in the same classification group. NDSA athlete's are assigned a classification group based on his or her functional abilities to assure equitable competition. We use four classifications for wheelchair users, including power chairs, and four classifications for individuals who can walk. A brief description of the classification system follows which can give a general idea of where an individual may fit in the system. (It is important to note that a "classification team" should do an assessment to determine every athlete's true classification. A classification team typically consists of two or three individuals such as physical therapists, physicians, and sports/recreation professionals. Classifiers have been trained and certified by NDSA to test and observe an athlete's movement patterns, abilities, and limitations. They look at such things as how the athlete grasps objects, freedom of movement in limbs, and balance.



Athletes are divided into classes. Some run in classes that use assistive devices for balance (above) and some run in classes for those without any aids (left).

CLASS 1 Severe involvement in all four limbs. Limited trunk control. Unable to grasp a softball. Unable to propel a wheelchair.

CLASS 2 Severe to moderate involvement of all limbs. Propels wheelchair very slowly or pushes with feet. Poor functional strength and severe control problems in arms.



High Toss (Top and Bottom photos): Athletes competing in the high toss must toss a wooden club (or soft shot put) over a high jump standard.

Slalom (Middle photo): Part of the slalom course requires an athlete to complete a 180 degree turn within the boundaries of the "reverse gate." Penalties are given for crossing over the lines or knocking cones over.

CLASS 3 Moderate involvement of all limbs with fair functional strength and minimal control problems in arms and torso. Uses wheelchair.

CLASS 4 Legs have moderate to severe involvement. Good strength and minimal control problems in arms and torso. Uses wheelchair.

CLASS 5 Legs have moderate to severe involvement. Good strength and minimal control problems in arms and torso. Uses wheelchair.

CLASS 6 Walks with moderate to severe involvement of all limbs. Does not use assistive devices for balance. Balance problems when running or throwing. More arm involvement than Class 5.

CLASS 7 Moderate to minimal involvement on one side. Good functional ability on non affected side. Walks/runs with noted limp.

CLASS 8 Minimally affected. May have minimal coordination problems. Runs and jumps freely. Has good balance.

The field events have many modifications. Familiar events, such as the shot put, discus and javelin, are offered for some classifications with the weight of the implement varying with the classification. Examples of some modified events include: throwing a wooden club, tossing a soft shot (a small leather bag filled with shots) over a high jump standard, tossing the soft shot for precision at a target and kicking a rubber ball for distance.

If this has grabbed your attention and you want more information about specific track and field events, NDSA rulebooks are available and recommended. You can also inquire about competitions or programs in your area. Contact the National Disability Sports Alliance at: 25 West Independence Way, Kingston, RI 02881; phone: (401) 792-7130; Web site: http://www.ndsaonline.org. ■

She has organized an annual regional track meet for physically challenged athletes, the Challenge Games, since 1989.

Traumatic Brain Injury, Then and Now

by Jan Blacher, PhD

Jack and Jill went up the hill...Jack fell down and broke his crown
Humpty-Dumpty sat on a wall, Humpty Dumpty had a great fall...
Rock-a-bye baby on the treetop...when the bough breaks
the cradle will fall...

Summertime, and the livin' is ... dangerous. Most children are home from school, and many zip along sidewalks and streets on bicycles, skateboards and in-line skates. So, too, do newly licensed teenagers and, presumably, seasoned drivers cruise the roadways. Accidents happen. And the result is often more than a sprained wrist or ankle.

The National Pediatric Trauma Registry in the United States tracks data on the more than 80,000 children who sustain trauma each year. According to Ronald Savage, an expert in traumatic brain injury (TBI), just as many children recorded in this databank sustained traumatic brain injury as fractures.

How many children suffer head trauma? A lot! Published estimates place the incidence of significant head trauma between 200 and 300 per 100,000 children and adolescents, or between 54,000 and 81,000 per year in the US. That number is probably even higher since symptoms of brain injury are similar to other categories in special education that are more familiar to school personnel. Many children with TBI are incorrectly classified by registries or databanks in special education as being learning disabled, developmentally disabled, emotionally disturbed or as having attention deficit hyperactivity disorder.

The term "traumatic brain injury" refers to a specific type of disability that occurs after birth (usually, but not always, due to accident or abuse); in fact, it is sometimes referred to as "acquired brain injury," as opposed to something with a genetic or "unknown" cause.

The consequences of TBI depend heavily on the type of injury, on the part of the brain where the injury occurred and on the age of the child. At one time it was assumed that children would recover better and more quickly if the accident occurred in early childhood, in the belief that brain plasticity would aid in recovery. Now it is recognized that younger children, ages birth to five years, have a more difficult time recovering because their brains are injured during a period of rapid brain growth and maturation. Indeed, since older adolescents and young adults have simply had a longer time living and coping with daily events, they have more practical knowledge and experience to help compensate for an injury to the brain. This new knowledge makes the fact that the majority of brain injuries occur in children under the age of 10 even more cause for concern. Incidentally, twice as many boys as

Welcome Resources Technology Edu/Toys Healthcare Subscribe

eparent.com

New! Visit the EP Web site, EParent.com, and discover...

TOYS—The new eToys Web site (www.etoys.com) teams with EP's Web site, EParent.com (www.eparent.com) to offer ideas, information and imaginative toys for families with kids who have special needs. When parents, teachers or caregivers shop at eToys and visit the co-branded EParent.com site, they'll find hand picked toys and games, plus featured articles from EP Magazine. The site also features direct links to the EParent.com shop at eToys, and eToys products recommended by experts or reviewed by organizations chosen by EP Magazine.

EDUCATION—EParent.com's newly-constructed Education channel (EDU/TOYS tab) yields a wealth of current articles on topics such as IDEA, IEPs, assistive technology, transitioning and inclusion. These are supplemented by a growing directory of schools, camps & residences, which can be found in the "Directories" link of the "Resources" channel.

ON-LINE ARCHIVES—Now, EParent.com users can preform keyword searches through our on-line archives and purchase articles which have appeared, as far back as in the eighties, in EP Magazine (recipient of awards from Folio:The Magazine for Magazine Management, Easter Seals, Consumer Healthcare Group). These include classic pieces on such subjects as early childhood, rare disorders, technology, education, medical research update, transitioning, travel, all of which have distinguished EP Magazine through the years.

MORE TO COME IN 2002—You can also click through our EP Library (www.eplibrary.com) which contains books, videos and software encompassing almost 50 specific and general categories, with more than 650 titles. Of course, we will continue to refresh and improve EParent.com in 2002, and look forward to receiving your comments and suggestions. Log on and find out what we are all about!

girls sustain a traumatic brain injury.

What are some of the common causes of TBI? The national registry on brain injury, mentioned above, reports that most pediatric TBI injuries result from motor vehicle collisions (27.1%) and falls (26.5%), like the one Jack, and so many others in classic nursery rhymes, took. Yet the number of brain injuries resulting from bicycle accidents (9.7%) or sports (5%) is also daunting. In an infant TBI is usually due to either child abuse or a fall.

Do certain activities place a child at risk? Despite their propensity to recover skills more quickly, older children and youth are more likely to engage in sports, a widespread risk factor for head injury. In the old days, coaches and even parents were quick to dismiss head injuries as "bell ringers" or just as part of the game. Today we are well aware that playing sports can carry a risk of concussion, a mild form of brain injury. Football is not solely to blame, although it is certainly the main culprit. High risk is also associated with ice hockey, rugby, martial arts, soccer and horseback riding.

James Kelly and Ronald Savage have written eloquently about how best to evaluate concussions in sports, whether—or when—the athlete should re-enter the sport, and what parents and educators should be aware of when the athlete returns to play. Their report draws on data from the Centers for Disease Control and Prevention estimating 300,000 sports-related concussions in the US each year.

Kelly and Savage provide explicit guidelines for determining whether to return an athlete, or a child, to the game. For example, according to their guidelines, after a grade 1 or mild concussion, an athlete can be returned to play only if he or she is symptom-free at rest, or symptom-free with exertion within 15 minutes of the injury. In a grade 2 or moderate concussion, the individual should refrain from sports for at least a week. In a grade 3 concussion, which is the most severe, there is typically a loss of consciousness; thus, return to play should occur after a minimum one-month recovery. However, there are exceptions and caveats even to these guidelines, allowing more or less rest and recommendations for follow-up examination.

In an extensive review of neuropsychology's contribution to understanding brain injury during sports, Ruben Echemendia and Laura Julian propose that neuropsychological tests may be more useful than traditional neuroimaging techniques because they can detect subtle losses in an athlete's attention and concentration. Echemendia and Julian also note that these traditional neuroimaging techniques, such as computerized tomography (CT) and magnetic resonance imaging (MRI), may not detect abnormalities, even when the injured child or his parents report somatic complaints or cognitive impairment following the concussion.

Most parents (and educators and

coaches for that matter) are not aware of post-concussion syndrome, which refers to repeated concussions over an extended period of time. Obviously, the more frequent the concussions, the greater the likelihood that there will be neurological, cognitive and/or behavioral deficits in the child or young adult.

It is important that parents, teachers and other professionals who work with the child monitor his or her cognitive, behavioral and physical changes for six to eight weeks following an injury. Fortunately, with a first injury, no permanent negative effect is likely, and full recovery of the injured child is expected. But, because a child active in sports can have four or more different coaches during high school, parents must be responsible for being aware of their child's injury history and making sure each new coach is also kept apprised.

Does a child's "special need" immunize him at all from further traumatic brain injury? Sadly, no. In fact, some children with special needs are at even higher risk for injury than children in the general population. For example, children whose behavior is characterized by inattention, impulsivity, hyperactivity, highly disturbed reactions, aggression, irritability and/or depression are less likely to be tuned into what is going on around them. They are more likely to engage in risky or careless behaviors—such as stepping in front of a moving vehicle—which can lead to injury.

Researcher Jenny Sherrard and her colleagues in Australia recently published results of a large-scale study on injury risk in about 500 young people ages 4 to 18 years with an intellectual disability. The investigators used data collected across two time periods five years apart, which allowed them to calculate risk factors over time. Parents answered questionnaires about the child's development and behavior and about family functioning and economic status. The authors identified three risk factors highly associated with injury:

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

Coming Soon!

HYPERBARIC OXYGENATION FOR THE COMATOSE CHILD

There is some hope for the comatose child suffering from severe brain injuries, cerebral palsy, or anoxic encephalopathy. Children with Glasgow Coma scales from 3-5 present tremendous financial and emotional burdens, since these little ones may live for many years. When considering care of tracheotomy, gastric tube for feeding, physical therapy, occupational therapy, speech therapy, nursing care, recurrent hospitalizations, medications, vans, and modifications to the home, expenditures may represent multi-million dollars.

Intensive hyperbaric oxygenation is no miracle, but it provides some hope. In certain instances the child is able to communicate verbally, by computer or word board. Eighty percent have the G-tube removed and seventy percent have the tracheotomies closed. Frequently, bowels become normal and nutrition is re-established. Routine monthly medications are reduced and hospitalizations are markedly decreased. Although few children will return fully to society, substantial improvements will give them a better quality of life in addition to a ninety percent reduction in overall costs.

For more information on hyperbaric oxygenation therapy and life planning, call the Ocean Hyperbaric Neurologic Center at (800) 552-0255.

Hyperbaric Oxygenation for Cerebral Palsy and the Brain-Injured Child..

by R. A. Neubauer, M.D.

Dr. Neubauer's new book is a complete guide written for the professional as well as the caregiver of exceptional children. The book describes the latest information on hyperbaric oxygenation therapy including improved brain function as visualized through functional imaging. Clinical and scientific data along with references are included.

continued from page 87

having epilepsy, which increases the likelihood of falls; having clinically significant levels of behavioral or emotional problems; and having an overly sociable temperament (e.g., attempting more risky activities without a full understanding of the consequences). Clearly, acquiring a brain injury in addition to another disability constitutes a double-whammy for both the child affected and his parents.

How is the family affected by a traumatic brain injury? The caretaking environment provided by parents, the extent of family involvement in rehabilitation, overall family functioning and the appropriateness of a child's educational program upon re-entry to school are all paramount in determining the long-range impact of TBI. Several recent studies by a team of researchers at Case Western Reserve University and Ohio State University (led by H. Gerry Taylor, Keith O. Yeates and colleagues) report on both short- and long-term outcomes for children with TBI. In all cases, children who have moderate or severe TBI and were from socially advantaged homes (whereby parents have higher incomes, more resources and, potentially, fewer family stressors related to the parents' health or work) had lower risk of depression and lower rates of other new psychiatric disorders following injury. These studies determined that "environmental advantages" are critical for predicting positive outcomes in children after injury.

Furthermore, siblings seem to adjust well to having a brother or sister with a serious TBI, as reported in a study by Mary McMahon and her colleagues. These researchers hypothesized that siblings of affected children might have more

Loneliness shouldn't be a side effect of your child's disability.

"acting out" or behavior problems, as well as more "acting in" problems, such as depression or poor self-concept. However, their studies found that there were no significant differences in these areas when, 3 to 18 months after the original injury, the siblings were compared to their classmates. With only 12 siblings involved, this was a small, but clinically useful study. Is this really good news? You bet—because parents can be in control of providing a positive and supportive family environment for both the child with the TBI and any siblings.

Is it possible to pick up all the pieces after a traumatic brain injury? It is heartening to know that rapidly developing technology can better detect brain abnormalities and pinpoint areas of functioning—such as social skills, the management of emotions, mathematical processing and reading—that might be negatively affected. At a more practical level, rehabilitation and education efforts have also advanced, and there is growing awareness of TBI among public school personnel. Promising interventions used successfully with children with learning or cognitive disabilities also seem to work with TBI. For example, "self-monitoring" techniques taught to children with TBI have proven effective for increasing on-task behavior, task accuracy and even improving social skills. If Humpty Dumpty had lived today, it is likely that the neurosurgeons, psychologists, rehabilitation specialists and special education teachers would be pretty successful in putting him back together again. organizational spotlight

The Muscular Dystrophy Family Foundation, Inc.

by Judith R. Duncan

When Frances and Dennis Clouser's son, Luke, was 5 years old, he began having difficulty standing and walking. Eventually, he was diagnosed with Duchenne muscular dystrophy (DMD), a progressive neuromuscular disease affecting primarily males and which limits the lifespan to the teens or early 20s. The Clousers contacted the Muscular Dystrophy Foundation for assistance. Now more than 15 years later, Luke and his family are still clients of the Foundation and strong supporters of the national nonprofit agency.

The Clousers are just one of the multitude of families nationwide served by the Foundation since it was established in 1958. The Foundation's original mission was to provide support services to families in Indiana affected by DMD. In 1997, the Foundation changed its name to the "Muscular Dystrophy Family Foundation®" (MDFF). By adding the word "Family" to its name, the Foundation sought better to reflect its broader mission—to serve the entire family unit. The Foundation understands that a neuromuscular disease doesn't just affect the person with the disease; every member of the family is affected in some way and therefore every member is eligible to receive services.

Luke Clouser

MDFF assists families from the day of diagnosis until their services are no longer required. The Foundation provides items other agencies do not and many items not covered by insurance, including manual and power wheelchairs, hospital beds, van lifts, breathing machines, ramps, shower chairs and computers. MDFF also offers camping scholarships, clinic services, home visits and school and work advocacy as well as assistance with funeral expenses.

In 1997 the Foundation established a toll free number for families to use. As the Foundation soon discovered, limitations imposed by private insurers, Medicare, Medicaid and reduced funding from other sources necessitated the expansion of the Foundation's services to a national level. From 1997 to 2001 the number of requests the Foundation received increased 400 percent.

MDFF increased its staff to handle the increase and began to focus on providing adaptive equipment. Today, MDFF serves families in 49 states and provides services to 43 different neuromuscular diseasesMonthly clinics held at the MDFF office in Indianapolis, Indiana, are open to any child or adult with a neuromuscular disease. As MDFF Vice President Denise Hancock states, "We call our clinic services 'One Stop Shopping' since all the proper disciplines are in place to provide the personalized care our families require." At these clinics, services are available from a wide range of professionals, including a nurse, occupational therapist, physical therapist, genetic counselor and pulmonary specialist. Also on hand to help out are the MDFF medical director and director of social services.

MUSCULAR DYSTROPHY
FAMILY FOUNDATION®
No Boundaries®

Thanks to a recent grant of $40,000 by the Efroymson Fund, a fund of the Central Indiana Community Foundation, the MDFF has been able to add an assistive technology specialist to their cadre of professionals. The specialist facilitates a monthly equipment clinic; orders, maintains and repairs equipment for families; writes letters of medical necessity; and assists clients with insurance claims and Medicaid waivers. The grant will also aid the agency in responding and serving client equipment needs much faster than in the past.

"Families can reach a staff member seven days a week, twenty-four hours a day. Since equipment breaks down after hours and families need emotional support holidays and weekends, we try to be available to our families at all times," Hancock adds.

MDFF has no plans to open offices in other states. The Foundation wants to use its funds to provide services, not for salaries and overhead. MDFF has found that it is more economical for them to fly a staff member to assist a family in another state than to open another office. The Foundation does not charge any fees to families requesting assistance; however, all available family resources must be utilized before MDFF can provide assistance.

MDFF conducts no research and is not affiliated in any way with the MDA or the Jerry Lewis Labor Day telethon. While the MDFF believes that research is extremely important, the organization believes that having the proper equipment and support in order to live an independent and productive life is equally important. The agency's slogan" No Boundaries®" is supported by its mission to offer equipment and support to eliminate boundaries for anyone with a disability.

The Muscular Dystrophy Family Foundation" also focuses on an individual's ability rather than his disability. When Luke Clouser graduated from high school and wanted to attend college, he encountered resistance from many funding sources. These organizations wondered if Luke would be able to keep up with his classes since he required a ventilator to breathe and the full services of a full-time aid. Through the advocacy efforts of MDFF, Luke is now within two classes of obtaining his degree. "We truly don't know how we would have managed if it hadn't been for the Muscular Dystrophy Family Foundation®", says Dennis Clouser. "Whether we need a van lift or a shoulder to lean on–they're always there to help us." EP

Universal Newborn Screening

In 1961, Dr. Robert Guthrie of the University of Buffalo developed a laboratory test to detect phenylketonuria (PKU) in newborns. PKU is an inherited metabolic disorder resulting from an enzyme deficiency; if left untreated, it results in profound mental retardation. In 1963 Massachusetts became the first state to mandate screening for PKU, which can be treated by lifelong dietary management and counseling. The National Association for Retarded Children (now The ARC), the Children's Bureau and the Kennedy Foundation were foremost among the organizations that pushed for widespread adoption of the Guthrie test, and by 1966 it was required for all children by all 50 states and the District of Columbia.

Dr. Guthrie and other researchers continued to develop newborn screening (NBS) tests to detect many more disorders, and each state decided what screens would be available for its newborns. Significant disparities resulted; in 1997, in Massachusetts, infants were tested for 10 or more disorders, while Utah's babies were screened for three. Montana and South Dakota each mandated three tests and offered one other by special request only. In the same period, with the introduction of ever-smaller and more powerful microprocessors, technology and equipment became significantly more sophisticated. This permitted testing that had not been feasible before. A process called tandem mass spectrometry (tandem MS, MS/MS) can now run tests for nearly 40 disorders at one time. None are curable, but all are treatable.

In the last two years, many states have expanded their NBS programs. Almost all Pennsylvania hospitals now offer the full spectrum of testing, although the law mandates testing for only six. Massachusetts routinely screens for more than 15 disorders and is running a pilot program offering 30+ tests. Wisconsin has almost tripled availability, from 7 tests to 20. Yet universal NBS still engenders much controversy, and there are many issues to be resolved before consensus can be reached on how the US will move forward.

The data tells us that of the four million babies born in the US each year, ten to twelve thousand may have one or more of these detectable...and treatable...disorders

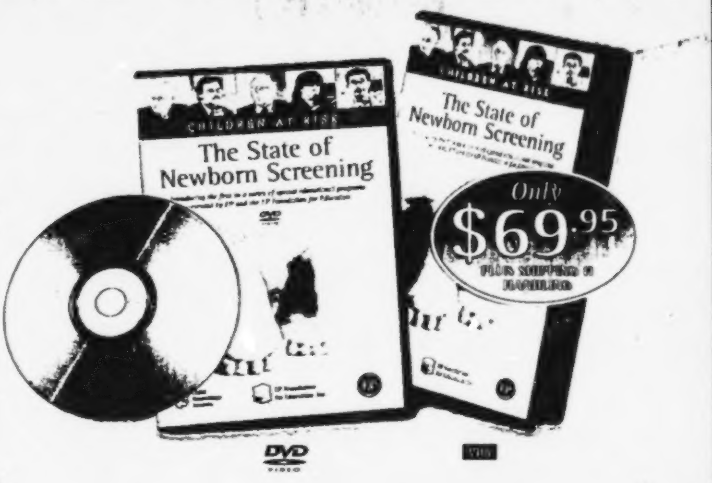
ISSUES: These may be economic, political, professional, sociocultural, religious. Capital spending, training, payment policies, long-term follow-up; insufficient hard financial data; union issues; professional knowledge levels and practice habits; citizen knowledge, and cultural and religious beliefs and practices; insurance, managed care companies, Medicaid, ChIP programs, the uninsured–all these and many more must be part of discussions and resolution.

With the current system, a child born in Louisiana with galactosemia will likely live a life marked by mental retardation and other special health care needs, while similarly affected children born the same day in most of the rest of the country will receive immediate treatment and become productive members of society. The data tell us that of the four million babies born in the US each year, ten to twelve thousand will have one or more of these detectable disorders, an almost-negligible number. The overall cost or benefit to our society, though, will vary wildly from one child to another because of the patchwork of screening availability. We as a nation must find a way to embrace universal NBS and make it routine for all children born in the US. More than that, it is downright wrong not to do so when it has proven its worth time and again!

It is a question of education and awareness. Research shows that the average couple planning to have children does not know anything about existing screening programs, much less the capabilities offered by tandem MS, largely because OB/GYNs, pediatricians, genetic counselors and related professionals are not familiar with universal NBS. The education gap relates to professionals and consumers, rich and poor, people of every race, religion and ethnicity. Few people know much about any of the issues. Worse, among the people who do profess knowledge of NBS and the issues, a good deal of what they "know" is wrong.

The information you need on Newborn Screening is finally available on DVD and video

Children at Risk:
The State of Newborn Screening
is now available on DVD and VHS. Introducing the first in a series of special educational programs presented by EP and the EP Foundation for Education, Inc., a 501(C)3 Not For Profit Corporation.



EP Foundation for Education, Inc. Child Neurology Society

Newborn screening can detect up to 39 metabolic disorders from one blood spot. All are treatable when diagnosed at birth, offering the chance for a full and productive life.

Leading medical and scientific professionals are gathered to provide the most current information available. You can view this valuable resource at your convenience and the DVD is indexed so that key topics are easily accessible.

familiar faces

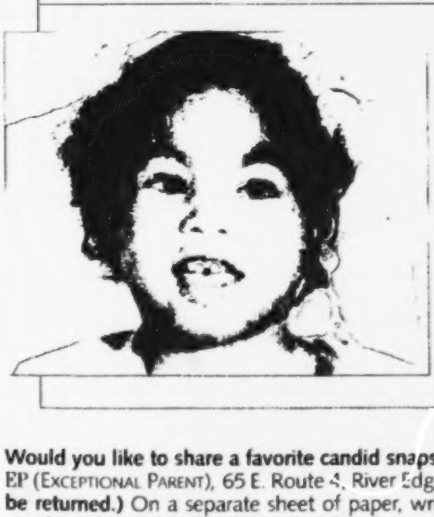
CONNOR

Connor Stueckle cools off on his sixth birthday—a hot one—splashing in the fountain at the Seattle Center. Connor has gross and fine motor delays, sensory integration dysfunction and is non-verbal. He loves the water, swinging with his dad, watching videos, riding on extreme roller coasters and visiting his Grandpa.

ANTHONY

Anthony Paul Pratti, 3, loves to watch Elmo videos and play on the computer. He rides the bus to preschool where he receives occupational, physical and speech therapies. Anthony, who was born with spastic quadriplegic cerebral palsy and autism spectrum disorder, garnered medals in two "Kid's Classic" races. "Nothing stops my little man," his mother proudly writes.

MAYA



Maya Vega, 3, loves the Teletubbies, music and babbling. Maya has developmental delays, seizures and cerebral palsy. Her mom and dad, Idaliz and Ray, write that Maya is the most huggable little girl and they could hug her all day long.

MICHAEL

Michael Arechavala, 3, loves playing with his brother, Kevin, 9, and sister, Michelle, 5. Michael has Down syndrome, and attends a fully inclusive preschool all week where he receives OT, PT and speech therapy. He enjoys going to the playground, eating ice cream and hanging out at the beach.

JAKE

Jake Alan Hetrick, 5, and sister, Eliza, 2, have a great time together. Just like a typical older brother, he laughs when she gets into trouble! Jake has cerebral palsy, cortical blindness and has microcephally. He survives his twin, who died in utero from twin-to-twin transfusion syndrome. He attends preschool during the week and a special needs Sunday school class. His favorite things are music, ice-cream and swimming.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (EXCEPTIONAL PARENT), 65 E. Route 4, River Edge, NJ 07661. (Please do not send originals or "one-of-a-kinds" as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

738

As our volunteer clearly demonstrates, 21* pediatric medical journals can be quite difficult to digest.

In fact, unless you have a medical degree we wouldn't recommend it.

If you have an interest in the latest breakthroughs and research published in pediatric journals, but don't have the medical training required to easily digest the information, there is an alternative.

ChildHealthMonitor.org publishes articles adapted from the latest monthly issue of each of the world's leading pediatric publications*. The information is the same. The difference is that much of the medical jargon is replaced with everyday language. It's also online which means that anyone with an Internet connection can now have instant access to reliable, useful information on the latest advances in treatment, prevention, and caring for kids.

Simply, visit **www.childhealthmonitor.org** and you too can have unlimited access to hundreds of simply written articles on up-to-the-minute pediatric discoveries.

We think you'll find this option much more palatable. (Our volunteer did.)

Announcing A Special Offer From EP Press

Patient Persistence

Adele M. Gill

Patient Persistence

ON SALE NOW! This book celebrates the ability of people to overcome obstacles to achieve their goals. The author, Adele Gill, is a certified disability analyst, a Fellow of the American Board of Disability Analysts, and an advocate of inspirational and motivational self-help. Ms. Gill has divided the book into two sections, Hope and Courage. Both contain selections that deal with turning points in people's lives, times when they found strength, hope, and the courage to persevere in the face of adversity. This book offers help and hope to those who feel that their lives are out of control or that things have gotten so bad that there will never be a way to make them better. Through examples from the lives of real people, this volume demonstrates that there is always a way.

Code # EP8004GN ~~Price $19.95~~ **Sale $15.95**

No Apologies for Ritalin

Vidya Bhushan Gupta, MD

NO APOLOGIES FOR RITALIN

ORDER NOW & SAVE! This book takes an in-depth look at attention deficit disorder/attention deficit hyperactivity disorder (ADD/ ADHD). Vidya Bhushan Gupta, MD, MPH, a Board-certified pediatrician and a Fellow of the American Academy of Pediatrics, is Director of Developmental-Behavior Pediatrics at Metropolitan Hospital Center, New York City. In his book, Dr. Gupta eloquently educates parents of children with ADD/ADHD about the disorder and available treatments, so that they can make informed choices for the care of their children. The first portion of the book describes what is medically known about ADD/ADHD, including causes and diagnostic methods; the second part outlines available treatment options, including Ritalin and other drugs, dietary changes, herbal therapy, and behavior modification. Dr. Gupta's purpose is to help parents of children with ADD/ADHD to stop blaming themselves for their child's disorder and to investigate and use appropriate therapies, including Ritalin and other medications when indicated, without guilt.

Code # EP8012AD ~~Price $19.95~~ **Sale $16.95**

These books are published by EP Press, the book publishing division of Exceptional Parent magazine, the country's oldest and most widely read publication for families of children and adults with disabilities and special health care needs and the physicians, allied health care professionals and special education teachers involved in their care and development. **For a limited time these books can be ordered at this special price by calling EP Library at 800-535-1910, or through their web site at www.eplibrary.com. The Window of the Body: Oral Signs of Systemic Disease

by Michael A. Kahn, DDS, and Jerry E. Bouquot, DDS, MS

The mouth has often been called the barometer of a person's health. Serious illnesses, conditions or genetic disorders may first present with mouth conditions such as unusual bleeding or multiple lumps and bumps in the mouth, extra or missing teeth or their premature loss. These mouth changes are frequently helpful in determining the underlying disease or its cause.

Unusual Bleeding in the Mouth

There is a wide range of diseases or conditions of the human body which may first be detectable, or whose diagnosis can be confirmed, by signs of bleeding within the mouth. The diseases or conditions that can affect children and teenagers include infectious mononucleosis, measles, hemophilia, leukemia, and vitamin deficiencies, particularly vitamins C and K.

Infectious mononucleosis ("mono" or " kissing disease")

Children usually become infected with the Epstein-Barr virus (EBV) that causes mono through saliva contaminated with EBV on fingers, toys, or other objects. Teenagers usually get EBV through direct transfer of saliva, such as shared straws or kissing. In the United States, it is estimated that approximately half of the population is exposed to EBV by college age.

Children less than four years of age typically experience fever; swollen, tender neck glands; sore throat; liver and spleen enlargement; runny nose or cough. Older children have similar symptoms but less often have an enlarged liver and spleen, runny nose and cough. In the mouth, the tonsils may be enlarged and may have pus on the surface. One can sometimes observe tiny bleeding spots on the roof of the mouth during the first day or two of the infection. The gums may also get red, sore, bleed and have a foul smell. Diagnosis can be confirmed by special laboratory tests.

Measles

Measles is an infection caused by a virus (paramyxovirus) that presently occurs only in children who are not given the available measles vaccine or, in rare instances, when the vaccine fails. Most cases start in the spring and are spread through contact with someone who has the infection and sneezes or coughs near them. The typical skin rash appears after symptoms of fever, lack of energy, runny nose, red eye and a cough.

The most distinctive early mouth sign of measles is Koplik spots on the lips, cheeks and roof of the mouth. These are numerous, small blue-white flat growths that look like grains of salt. Other mouth findings include a white yeast infection that can be rubbed off and bleeding, foul-smelling gums. The tonsils may also look enlarged. Developing adult teeth can be affected so that when they appear in the mouth they show pits and small holes in the

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in Exceptional Parent.

How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly.

Be sure to tell them you saw their ad in Exceptional Parent!

continued from page 97

enamel. Diagnosis is usually straightforward, based on the patient's symptoms and knowledge that measles is "going around." For a single or unusual case special laboratory tests are available.

Hemophilia

Hemophilia is a group of bleeding problems associated with a genetic lack of one of the clotting elements of the blood. The most famous historical cases are male children of the European royal families, many of whom died from a direct result or complications of uncontrolled bleeding. Presently, blood transfusions and replacing the missing clotting element spare many lives. Since hemophilia A (lack of blood factor VIII) is the most significant and common type it will be the only one discussed here.

Hemophilia A is known as a genetic X-linked disorder; females may have the defective gene, but the disease is almost always seen only in males.

Hemophilia A is known as a genetic X-linked disorder; females may have the defective gene, but the disease is almost always seen only in males. Failure of normal clotting after circumcision is typically one of the first signs that a bleeding disorder is present. The outward signs and symptoms vary from mild bleeding problems to severe, life-threatening bleeding. In toddlers, oral cuts or bruises from falls and bumps may result in significant blood loss. Even normal physical activity may result in internal bleeding of the skin (deep bruising), muscles and large joints such as the knee or elbow. Scar formation often results, causing crippling deformities of the joints. Sometimes, a tumor-like growth forms in the body or within the mouth. Routine dental treatment such as cleaning teeth may result in uncontrollable or delayed bleeding. Blood clotting screening (nonspecific) tests should be ordered for any child suspected of having this or other bleeding disorders.

Leukemia

Leukemia may affect both children and adults. For unknown reasons thought to be genetic and environmental, a stem cell in the bone marrow becomes cancerous as it develops, multiplying rapidly and preventing the marrow from making enough red blood cells, white blood cells or platelets. Leukemia can be classified into acute or chronic types with several subdivisions. Acute leukemias, if untreated, run an aggressive course and often result in the death of the patient within several months. Chronic leukemias usually run a milder course although, without treatment, the patient will also die. Certain genetic disorders or syndromes present an increased risk of developing leukemia. In addition to Down syndrome, these include such rare syndromes as adult Bloom syndrome, Schwachman syndrome, ataxia-lymphoma syndrome Klinefelter syndrome, Fanconi's anemia and Wiskott-Aldrich syndrome.

Many of the signs and symptoms of leukemia are related to the significant reduction of white and red blood cells. Because there are fewer red blood cells that carry oxygen throughout the body, patients complain of no energy, easy tiring and shortness of breath upon mild physical activity. The cancerous cells can invade organs, such as the liver and spleen, and cause the lymph nodes to enlarge. Patients with leukemia may demonstrate easy bruising and bleeding resulting from the lack of blood platelets. Tiny bleeding points on the roof of the mouth may be seen, along with bleeding from the gums for no apparent reason. Deep mouth ulcers often appear, usually affecting the gums most severely. A widespread oral yeast infection is common, as are cold sores (fever blisters). Occasionally leukemic cells invade gum tissue, resulting in a widespread, boggy, nontender gum enlargement. Finally, the bone around the bottom of the tooth's root can become infected, causing a toothache.

Vitamin C and K deficiencies

In the US, significant vitamin deficiencies are uncommon. Children with malabsorption (food nutrients do not get into the blood) or eating disorders, teenagers who follow fad diets and people who have alcoholism are the groups most commonly affected. Vitamin C (ascorbic acid) is necessary for the proper formation of collagen, the major protein of cartilage, bone and connective tissue. This vitamin is present in a wide variety of fruits and vegetables and is especially abundant in citrus fruits such as oranges and grapefruit. Vitamin K is necessary for the proper formation of various proteins, including those involved in clotting. Vitamin K is present in a wide variety of green vegetables and is produced by intestinal bacteria.

In the US, a deficiency of vitamin C—scurvy—is usually limited to those peo-

continued on page 102

ple who lack an adequate diet of fresh fruits and vegetables. One of the commonly-affected groups is inner-city infants whose diet consists entirely of milk. The outward signs are related to a lack of collagen formation. For example, weakened blood vessel walls may result in the formation of bruises in the mouth. Wound healing is delayed and recently-healed wounds may break down. Children are particularly susceptible to painful bleeding just above the bone surface. Within the mouth, generalized gum swelling with spontaneous bleeding is observed, as are ulcers, loose teeth and loss of bone around the teeth. Untreated scurvy can lead to death from bleeding within the brain.

Insufficient vitamin K causes a lack of blood-clotting elements that result in gingival (gum) bleeding for no apparent reason.

A lack of vitamin K may be seen in patients with malabsorption problems or in those whose intestinal bacteria have been eliminated by long-term use of broad-spectrum antibiotics. Oral blood thinners such as coumadin also reduce the normal activity of vitamin K. Insufficient vitamin K causes a lack of blood-clotting elements that result in gingival (gum) bleeding for no apparent reason. If uncorrected, death may result from uncontrolled bleeding.

Multiple Lumps or Bumps in the Mouth

Some common and uncommon diseases and conditions of the body are revealed by a display of generalized or individual multiple lumps or bumps (lesions) in the mouth. The tongue is a favorite site for these lesions; they may be exhibited at birth or in childhood in at least seven genetic diseases. Other conditions causing childhood lumps and bumps in the mouth include Crohn's disease and tuberous sclerosis.

Enlarged Tongue

An enlarged tongue most commonly occurs in children and can range from mild to severe. In infants, it may be manifested first by noisy breathing, drooling and difficulty in eating. In young children a lisp may develop, along with an open bite and a jutting lower jaw. If the tongue constantly sticks out from the mouth, it may develop sores, become infected and may even start to break down. Diseases that cause enlargement of the tongue from multiple lesions include Down syndrome and rare conditions such as hypothyroidism, Beckwith-Wiedemann syndrome, the mucopolysaccharidoses (MPS), multiple endocrine neoplasia syndrome type 2B (MEN 2B) and neurofibromatosis (von Recklinghausen's disease of the skin). In patients with hypothyroidism or Beckwith-Wiedemann syndrome, the tongue usually has a smooth generalized enlargement. The other listed conditions typically have multiple, separate bumps and lumps.

Hypothyroidism is caused by decreased levels of thyroid hormone in infancy; typically the patient exhibits lack of energy and fatigue; cool, dry, rough skin; swelling of the face, arms, and legs; huskiness of the voice; constipation and weakness. Not all of these signs might be readily apparent in the infant and a failure to grow normally might be the first indication of the disease. The general enlargement of the tongue results from an accumulation of certain substances in the deeper layers of the tongue; the lips may also appear thickened. The baby teeth and, later, the adult teeth may fail to erupt, although those that do appear normal. Abnormal thyroid hormone levels will confirm the suspected condition.

Beckwith-Wiedemann syndrome is a rare genetic disease that includes protrusion of part of the gut through the navel, enlarged organs such as the spleen and liver, increased height and the onset of diabetes within the first 30 days after birth. Affected children are more likely to get certain body organ tumors. The face may have a large reddish birthmark that covers the forehead and eyelids; the upper jaw tends to be underdeveloped. The main finding in the mouth is the overall tongue enlargement.

Down syndrome, caused by an extra gene located on chromosome 21, may result in mental retardation and many physical signs, including a flat face with a short nose, protruding lower lip, small rounded ears, loose joints, wide hands and feet, stubby fingers, extra neck skin and a lack of muscle tone in newborns. In the mouth, a common finding is a thick, enlarged tongue with numerous surface fissures (deep grooves). Teeth may be smaller than normal and either too many or too few. Genetic tests will confirm the diagnosis.

The mucopolysaccharidoses are very rare genetic diseases in which one of several enzymes, and thus an important group of tissue building blocks, is missing. Most types of MPS display some degree of mental retardation. Often, the affected person has pronounced features. Other symptoms may include stiff joints and cloudy corneas. There may be varying degrees of tongue enlargement. Other mouth findings include enlarged gums (especially in the front) and abnormally shaped crowns with pointed tips on the back teeth. In other forms of the disease, teeth do not erupt through the gums. Diagnosis is confirmed by laboratory tests.

Multiple neoplasia syndrome, type 2B (MEN 2B) is one of a group of rare genetic conditions characterized by tumors of the pancreas, adrenal glands, parathyroid/thyroid glands and the pituitary gland. In MEN 2B, the child or young adult will often develop thyroid cancer, adrenal tumors, and multiple bumps or lumps within the mouth. Patients usually have thin, long arms/legs with muscle loss. The face is narrow but the lips are thick and jut out. The upper eyelid is sometimes inside out and small bumps may be present on the eyelid. The first sign of the condition is multiple bumps in the mouth, most commonly on the tongue. The mouth bumps and those of the lips and eyes are actually benign nerve tumors that may appear on the inside of the cheeks, the gums, roof of the mouth and, commonly, at both corners of the mouth. Laboratory and genetic test values are necessary for a final diagnosis.

Neurofibromatosis is a relatively common genetic condition. Although there are at least eight different forms of the disease, the most common type is von Recklinghausen's disease of the skin. Patients exhibit multiple skin bumps that are usually harmless nerve tumors. The bumps may be present at birth but become much more numerous after puberty. They may get extremely large; the exact number of bumps varies greatly among patients. Another characteristic feature is the presence of colored spots on the skin that have been described as having a "coffee-mixed-with-milk" color. They are usually present at birth or appear during the first year of life. Freckles in the armpits are another common sign. The irises may have brown spots. Some patients may also develop brain tumors, mental retardation, seizures and curvature of the spine. In the mouth, it is common to find multiple bumps (nerve tumors) on the tongue with an increased roughness of the tongue surface. X-ray films of the jaws may show characteristic changes. Diagnosis is made from the presence of two or more of seven characteristic physical findings.

Some patients have enlarged gums as a side effect of medicine taken for seizures; others will have defects in the jaws that can be seen in X-rays.

Granulomatous diseases

These conditions have a common feature, a characteristic type of inflammation with a special appearance under the microscope. Within this group of lesions, Crohn's disease typically has its onset during the teenage years.

Crohn's disease is an inflammatory condition of unknown cause that mainly affects the end of the small bowel and the beginning of the large bowel, although it may involve the entire gastrointestinal system. Other sites that may be affected include the skin, eyes and joints. Approximately 30 percent of the time, the mouth signs appear before the stomach and bowel lesions. The gastrointestinal involvement leads to complaints of abdominal cramping and pain, nausea and diarrhea. Weight loss and malnutrition may develop, which can lead to decreased red blood cells and decreased growth.

Many different types of mouth lesions have been observed in Crohn's disease. The more common are multiple or separate bumps of the mouth and lips, a so-called cobblestone appearance of the mouth lining, and deep ulcers or holes, especially of the area beneath the gums. Biopsy of the gut lesions and the person's symptoms lead to a correct diagnosis.

Tuberous sclerosis (Bourneville-Pringle syndrome) is uncommon and classically displays mental retardation, seizures and angiofibromas, specific growths on the face. Besides cases of familial origin, this condition can be caused by random, unexplained genetic mutations.

Angiofibromas occur mainly in the crease of tissue next to the nose. Similar bumps can be found next to or under the fingernails. Other types of skin lesions are seen, including a focal area that has a rough surface or that lacks normal skin color. Some patients develop a heart tumor; others may have tumors in the kidneys.

In the mouth, the enamel of the front teeth is often pitted. Another common finding is multiple small bumps on the front gums; they may also be displayed on the lips, inner cheeks, roof of the mouth and tongue. Some patients have enlarged gums as a side effect of medi-

continued on page 104

continued from page 103

cine taken for seizures; others will have defects in the jaws that can be seen in X-rays. The appearance of the patient establishes the diagnosis.

Extra or Missing Teeth, or Premature Loss of Teeth

• Extra teeth

Extra teeth may be present when the child is born with a cleft lip and/or a cleft palate. One example is cleidocranial dysplasia, a rare genetic bone disorder whose most outstanding characteristic is the absence of a collarbone or one that is deficient on one or both sides. The child tends to be short, with a characteristic facial appearance of wide spaced eyes and prominent forehead. In the mouth, the roof is often narrow and high and cleft palate is often seen. Various dental changes are exhibited. The baby teeth often do not loosen and the adult teeth are delayed in appearing or only partially come through the gum. Many extra teeth may form in the jawbones but fail to erupt into the mouth. X-ray pictures of the jaws will demonstrate characteristic changes besides the abnormal teeth. The diagnosis is based on the above-mentioned signs.

• Missing Teeth

One condition that exhibits missing teeth is hereditary hypohidrotic ectodermal dysplasia, the best known of a group of genetic conditions in which at least two derivatives of the ectoderm (teeth, hair, nails, glands) are deficient in function or absent altogether. Hereditary hypohidrotic ectodermal dysplasia occurs much more often in males. In infancy the baby appears to have an unexplained fever, but actually, the body temperature cannot be controlled in the normal fashion because of a lack or reduced number of sweat glands. Death can occur from this heat intolerance. Other signs include fine, sparse blond hair; this conditions affects not only the head but also the eyebrows and eyelashes. The lips may stick out, as the center of the face is often not fully developed. The nails are often brittle and defective. Within the mouth, there is a lack of saliva due to undeveloped salivary glands and the number of teeth is markedly reduced. The crowns of the teeth are abnormal and often have a cone or pointed shape. These features determine diagnosis.

• Premature loss of teeth

In addition to a traumatic event, jaw infection, or cancer chemotherapy, numerous diseases can result in a premature loss of baby or adult teeth. The list includes diabetes, chronic or cyclical loss of white blood cells, Papillon-Lefevre syndrome, Down syndrome, scurvy, dentin dysplasia, regional odontodysplasia, Langerhans cell disease, leukemia, AIDS and hypophosphatasia.

Hypophosphatasia, a rare, genetic bone disease, is characterized by a lack or reduced amount of alkaline phosphatase, a particular tissue enzyme that is thought to play a role in the production of bone. This disorder is usually diagnosed in infancy although it may not appear until later in childhood or even adulthood. The diagnosis is based on the clinical signs and laboratory tests.

The infantile form usually presents after 6 months of age, when the infant shows a failure to grow. Vomiting and lack of muscle tone may develop. Skeletal malformations reminiscent of rickets appear (e.g., shortened, bowed limbs). Kidney stones also form, as do rib and skull deformities. In the childhood form, a hallmark finding is the premature loss of baby teeth with no apparent infection. The upper and lower front four teeth are usually affected first and may be the only teeth involved. Sometimes the inside of the teeth appears abnormal on an X-ray and the bone around the teeth may be reduced. In X-rays, the skull has an abnormal appearance that has been described as "beaten copper"–it looks like a piece of metal that has been repeatedly hit with a hammer. This look is probably due to thinning of the skull's inner plate of bone.

View Through the Window

Inspection of the mouth, the "window of the body," and its supporting structures is often an excellent, simple way for doctors to identify not only localized dental and gum infections but more generalized body diseases, genetic disorders and conditions. The informed doctor or parent can utilize this information to identify possible serious health problems and to initiate appropriate treatment early, which may lead to a more favorable outcome with fewer complications for the patient. Special Report

Part 1. The Beginning: How Parents Move Forward and Make Choices After Diagnosis

By Elizabeth King Gerlach

This is the first in a series of articles designed to address the issues that parents and families have to face as they strive to meet the needs of their children with lifelong disabilities.

Shared Perspectives

As parents of children with disabilities, when we stand side by side with a teacher, a doctor, a therapist or even a family member, we see our child differently from the way they do. Our children touch every place in our hearts. We see the child in relation to our whole life, a reflection of our dreams for them and for ourselves. We will be their lifelong advocates, caregivers and friends.

Because every individual and family has unique circumstances, each vision and journey will differ; but as parents of children with disabilities we have common ground. So much understanding can be gained by sharing stories and perspectives of other parents. We can help each other embrace the enormous changes that begin when we learn our child has a disability and support each other as we cycle from grief to action and discover new opportunities for our children and ourselves.

Getting the News

Not all of us get the news that our child has a disability at the same stage. Some of us receive it at birth, others when their formerly "normal" child experiences a life-altering accident. Still others learn it gradually, as their child misses certain developmental milestones and is later diagnosed as having a developmental delay.

No matter how severe or minor the disability, the shock of discovery and the cycle of emotions are universal. Scott Felsher's son was born with a clubfoot and also had difficulty breathing at birth. Scott recalls, "Looking back, it makes me realize what a normal human reaction it is to experience shock when you are faced with a physical abnormality. I would watch all the different nurses come through the unit and look at his chart. They would almost all lift up the blanket and look at his foot first. That tiny, infant foot might as well have been the size of Rhode Island. It hurt to see my beautiful baby boy and think that people would see his disability before they would see him." While clubfoot is not as severe a disability as many parents must face, Scott experienced the wide range of emotions most of us feel when we get the unexpected news of disability: shock, anger, sadness, denial, grief.

The composite wisdom of many parents also attests to the benefit of these general steps in moving from awareness to resolution:

- ○ Allow time to heal and time to grieve. Be patient with yourself.
- ○ Ask for help and support from people you trust who are good listeners.
- ○ When you are ready, contact local disability support groups through their national offices. Early interventionists or school counselors can also often provide contact information. It helps to know you are not alone.
- ○ Speak with other parents as well as experienced professionals such as family therapists, physicians, social workers, special education professionals, school mental health specialists and clergy.
- ○ Establish routines and engage in healthy behaviors; eat well and get enough rest.

INFORMING

EMPOWERING

Finding the right educational setting for their child with special needs is among the many challenges faced by parents.

AND KEEPING PARENTS INVOLVED

THIS SERIES IS MADE POSSIBLE BY AN UNRESTRICTED EDUCATIONAL GRANT FROM THE INTERNATIONAL FAMILY INSTITUTE AT THE CENTER FOR DISCOVERY IN HARRIS, NEW YORK. WWW.DISCOVERYIFI.ORG - WWW.THECENTERFORDISCOVERY.ORG

[illegible] 749

continued from page 105

"There are three basic components to processing emotions: awareness, expression and resolution," says Zack Schwartz, PhD, a clinical psychologist with a private practice in Oregon. "It is important to understand and interpret your feelings and then develop healthy outlets for them. Such outlets might include conferring with a confidante or exercising or expressing your feelings through artwork."

Other children in the family will also benefit from support during this initial phase. Siblings might feel confused, concerned or even left out. In addition to seeking professional advice, resourceful parents can help siblings adjust by keeping the lines of communication open, by finding time to spend alone with each of their children, and by involving them directly in the process as an advocate for their sibling and a teacher for other children.

Many organizations also offer general tips on helping siblings deal with their emotions. Good ones include the Sibling Support Project at the ARC web site and the Parent Advocacy Coalition for Educational Rights Center (PACER) (see Resources). Books for children, like *Views from Our Shoes: Growing Up with a Brother or Sister with Special Needs* (Woodbine House, 1997) and *Living with a Brother or Sister with Special Needs: A Book for Sibs* (University of Washington Press, 1996) can help siblings understand what other kids have been through. Of course, books for parents are indispensable, too (See Additional Reading).

Moving Forward

After the initial shock and uncertainty of learning the news our child has a disability, we must learn all we can about the disability so that we can make informed choices on the multiplicity of issues that will arise. These might include what therapies and procedures are necessary, what insurance will cover and what support services are available. By educating yourself about your child's disability, you will gain confidence in dealing with these issues. Still, it can feel like an uphill climb.

Purnima and Ruben Hernandez live in New Jersey with their son, Naryan, age 4, and their daughter, Sophia, age 2. Born three months premature, Naryan weighed a scant one pound. His six-month stay in the NICU encompassed treatment for his multiple infections, gastrointestinal and brain-related issues and many procedures, including laser eye surgery and spinal taps. He has since been diagnosed with autism and other developmental delays.

From the day Naryan was born, it was clear that his care was going to be an expensive endeavor. Purnima recalls: "When money issues arise then the battle begins with everybody. The fight has been constant on the medical and insurance front. Sometimes you are made to feel like a criminal or a wrong-doer, or as if you are to blame for the child's disability." In her experience, Purnima feels that gathering as much information as possible is the best step a parent can take to keep on top of the different aspects of medical care and insurance and to make informed choices. She notes: "As the disabilities are discovered we do complete research on what the issue is. We then analyze it and the options. As parents, we feel that we have to take a lead role in Naryan's recovery."

When God Doesn't Make Sense, by James Dobson (Tyndale House, 2001).

Information can be gleaned from many sources, including parents of other children with disabilities. MUMS: National Parent-to-Parent Network matches parents of children with similar disabilities. Beyond parent networks, an array of organizations offer resources, information and links. The Center for Discovery's International Family Institute Web site offers links to advocacy and legal resources, assistive technologies, early intervention, news services and magazines, government, medical information and more. The National Information Center for Children and Youth with Disabilities (NICHCY) provides good general information on a wide variety of disabilities.

Many parents have found it useful to establish a file system devoted to their child in order to keep track of the important papers and information that quickly accumulate. You can arrange separate folders for insurance claims, correspondence, individual doctors, therapists and direct support professionals (DSPs), education-related issues and other general information. Also invaluable is a separate binder or folder devoted to information on your child's specific disability, which can be readily duplicated and distributed to caregivers, teachers and friends. Day-timers, calendars or personal electronic organizers can help keep track of appointments and treatment intervals. A pocket-size electronic or print diary is also helpful for keeping track of daily observations and questions and for jotting down questions or insights to share with professionals.

Sometimes, among the mass of information and opinions from family, friends, and professionals, it is difficult to remember the significance of one's own wisdom and instincts. Purnima Hernandez stresses the importance of listening to one's inner voice alongside all the other voices: "Parents are given this amazing gift of instincts along with their child at birth, instead of a manual. To use it is your choice."

The Pondolfino family—Scottie, Jackie and Zachary in front of mom, Michele and dad, Jerry.

Navigating the Education System

After health and care concerns, achieving the appropriate education for their young child is often the greatest concern parents have. Fortunately, parents today have far greater options than ever before. Federal legislation called the Individuals with Disabilities Education Act (IDEA) mandates that children with disabilities be provided with a free and appropriate public education and related services from birth to age 21 years. Understanding IDEA and the rights and options it gives to your child will be a powerful tool as you negotiate decisions that will have a direct effect on your child's life.

IDEA identifies two stages of service for children, depending on their age. For children ages birth to 3, IDEA specifies that an Individual Family Services Plan (IFSP) must be developed to integrate multiple services for the child and the family. The IFSP is tailored to the needs of each particular child and could include family training, case management services speech, occupational and/or physical therapy services, and other options. Under IDEA, each state is required to have an Early Intervention Program. The National Early Childhood Technical Assistance System (NECTAS) is an excellent source for information on Early Intervention Services available nationwide (see Resources).

Under the law, children ages 3 to 5 years must be provided with the same services that their school district provides for school-age children who qualify for special education services. IDEA mandates that once a child enters school, a written plan called an Individualized Education Program (IEP) must be in effect within 30 days after the child has been evaluated and determined eligible for special education services. An IEP is developed by a team of educational and other specialists in coordination with the parents and in accordance with the unique needs of the child. It should be updated yearly. These updates provide focused opportunities for adjustments or modifications that reflect the child's evolving abilities and needs. Regrettably, there is no nationwide standard for the adequacy of special services for children; so the quality of services can vary tremendously from state to state and even between school districts.

Unique Children, Unique Choices

Even with all these protections, navigating the educational process and deciding which choices are right for your child can still be daunting. There is no set formula, no predetermined path. We can gather information and advice, but often we must simply try one avenue and see if it is appropriate or successful. Children and situations change, and raising a child with special needs requires not only diligence, but also flexibility. If your child's services are not meeting his or her needs or the needs of your family, you may need to pressure your school district to provide an adequate program. Sometimes the help of an attorney or an experienced educational advocate is necessary if agreement cannot be reached in an amicable manner.

My own son, Nick, now 16, was diagnosed with autism at age 4, although he showed signs of his disability from age 2. Our choices for him have run the gamut from homeschooling to various levels of inclusion within the school setting. When Nick was young, he was unable to cope with preschool settings. So, with consultation services provided, at our request, by our school district, we chose to implement an intensive at-home program for Nick for two years. Even though one early interventionist claimed we would "ruin our child's chances for future socialization," we have never found this to be the case.

We placed Nick in a full-inclusion setting with an assistant when he turned 7. We had to pressure the school district for his one-on-one instructional assistant, enduring comments such as: "We don't want to set a precedent." Eventually we convinced the district that the assistant was necessary to his success. Nick was then able to attend all regular education classes, with some curriculum and testing modifications, through the end of the eighth grade.

This year, as Nick began high school, he was scheduled to attend regular education classes only, but we soon determined that this setting was not appropriate for him. Because of adolescence and other transitions, his anxiety level rose significantly, and he had a much harder time keeping up with grade-level work. Now he spends much of his day in the resource room, with some regular-ed classes. We don't see this as a "step back" for Nick. We see it as being flexible and acknowledging what his present needs are.

An important component of the special education system is the availability

continued on page 108

continued from page 107

of a wide variety of placement options and a continuum of services. This continuum includes options from full inclusion to special class to a residential setting. Parents and professionals can work together to determine what is appropriate for each child and family. No family should ever be made to feel guilty if their choices are not in vogue or differ from the latest trend.

Federal law dictates that services be provided in the "least restrictive setting," with full inclusion the least restrictive and residential placement the most restrictive on the continuum of educational options. Parents must be prepared to exert pressure for a higher level of care (a more restrictive setting) when their child ceases to benefit from the current level of services. The real measure of the adequacy of services should be the child's ability to learn and grow within the program.

Michele and Jerry Pondolfino of New York knew their son Zachary was not developing as he should. They disagreed with their developmental pediatrician that "all children develop at different rates" and when Zachary was 8 months old, hired a county nurse to do a private evaluation. Michele relates, "The nurse validated what we suspected, that this was a very sick boy." Today, at age 7, Zachary still cannot crawl, walk or sit by himself. He has no reaching or grasping ability, he is nonverbal and both his oral and motor skills are very poor. Yet Zachary remains undiagnosed. Tests have revealed only atrophy in the frontal and temporal lobes as well as seizure activity. The Pondolfinos had finally decided that Zachary's disabilities were caused by a birth injury, until their younger son, Scottie, developed similar symptoms and a rare heart defect.

"After someone started listening, we started heading in the right direction," Michele says. "When you have a diagnosis you can then research what has worked for other individuals, as well as what to anticipate for the future. The early intervention team came out and did an evaluation, and determined that Zachary was eligible for services. By age 10 months Zachary was receiving physical and occupational therapy and even special education services."

Meanwhile, Michele gave birth to her daughter Jackie, now 5, and Scottie, now 2. Zachary eventually attended an integrated preschool program. For the first year he attended a half-day program; the following year, he went for a full day. But when Zachary turned 5, the Pondolfinos made a decision that surprised even them at first.

"We wanted a stimulating learning environment for Zachary, but knew it would need to veer from the path of conventional curriculum and teaching techniques in order for him to benefit. Obviously wheeling him up to a desk in a mainstream classroom was not going to work. We were looking for something more tailored to his capabilities and needs.

"We wanted a small classroom setting with a high teacher/student ratio, special education teachers, physical, occupational and speech therapists trained specifically to work with the most severely challenged population. Additionally, since Zach loves music, water and the outdoors, it was important for us to find a program that included these elements.

"I had heard about the Center for Discovery, a residential and educational facility in New York State, from an occupational therapist and decided to go there to look into respite services. We went for the tour thinking NO WAY would we ever consider residential placement for Zachary!" says Michele.

The family struggled with mixed feelings and held long deliberations with extended family members. The Pondolfinos made their decision to place Zachary at a residential setting with the help of their early intervention team. "Knowing that Zachary was going to receive optimal therapeutic services and creative teaching talents and have it all carried over into his after-school hours by a qualified staff of devoted caregivers gave us tremendous hope and comfort that he was indeed being given the best chance for success and highest quality of life. The staff was warm, the children were loved and well-cared-for, the facility was clean and located in a beautiful setting. I knew in my heart that this was where he needed to be."

A Medicaid waiver helped them cover expenses, and certain services were covered by the educational district. (*Note: Medicaid rules vary from state to state. Parents should research types of services that might be available to them by contacting their state's Medicaid office. Federal Medicaid Information can be accessed at: http://www.hcfa.gov/medicaid.*)

Two years later, the Pondolfinos are enthusiastic about their choice. "In the end it wasn't about us, it was about Zachary," says Michele. "We can do our best for him and we did, but they could offer something more." Many weekends, the family either visits Zachary at the Center or brings him home for a visit. Meanwhile, Scottie, who also has developed the same undiagnosed disabilities as Zachary, receives early intervention services at home, including special education, as well as physical and occupational therapy. The Pondolfinos are equally happy with this choice.

A Limit-Free Perspective

The stories above reflect only a few of the many possible choices that could be made by parents of children with disabilities. Our society is rapidly changing, and people with disabilities are gaining respect, recognition and acceptance in the larger community. Furthermore, new technologies, such as communication devices, are enabling individuals with severe disabilities to break old barriers. As parents, our continued advocacy and involvement will help further expand these possibilities.

"What brings us a lot of courage and

RESOURCES

Starred organizations also provide materials in languages other than English and/or address multicultural perspectives.

•The ARC
1010 Wayne Ave, Suite 650
Silver Spring, MD 20910
301-565-3842
http://www.thearc.org
Coordinates a network of local chapters which often offer respite care programs and other opportunities for persons with developmental disabilities, including the Sibling Support Project.

•Beach Center on Families and Disability
The University of Kansas
Haworth Hall, Room 3136
1200 Sunnyside Avenue
Lawrence, KS 66045-7534
785-864-7600
http://www.beachcenter.org
Distributes family-friendly products including manuals, booklets and videotapes. Web site offers links to statewide Parent-to-Parent organizations. Parent-to-Parent matches parents seeking information and support with other "veteran" experienced parents whose children have similar disabilities.

PARENTING

The Angry Child
Regaining Control When Your Child is Out of Control
Tim Murphy, Ph.D.

Anger can be a normal response to frustration or disappointment, but for some children it is an ingrained behavior that caused them and those around them needless misery. This book provides both the roots and the solutions for uncontrollable anger in children. Learn the 10 characteristics of the angry child; Four stages of anger and how to cope; the 5 C's of successful parenting and much more.

RH676XPA $24.00

Father Need NEW!
Why Father Care Is as Essential as Mother Care for Your Child
Kyle D. Pruett, M.D.

An easy to follow handbook which offers in depth advice for parenting children of all age groups from infancy through adolescence and adulthood. Learn not only why a father needs to take an active role in raising children, but also how to do so effectively.

RH7371PA 13.95

Special Kids Need Special Parents
A Resource for Parents of Children with Special Needs
Judith Loseff Lavin NEW!

Parents of children with special needs face unique emotional and practical challenges every day. These issues are seldom fully addressed by the medical community—an parents' most compelling questions remain unanswered. The author draws upon interviews with health care professionals, nationally recognized authorities and families of special need children to give readers the advice, encouragement and comfort they crave.

GP6622PA $13.95

The Parent to Parent Handbook
Connecting Families of Children with Special Needs
Betsy Santelli, Florene Steward Poyadue, Jane Leora Young

As a parent you have lots of questions, If you child has a disability you probably have even more. One of the best ways to find answers to your questions is through "Parent to Parent Programs". Written by two mothers that have been there this book will explain how these valuable programs work and how they can give you the help you need.

TW7671YP $12.95

What Baby Needs
William Sears, MD, Martha Sears, RN, and Christie Watts Kelly with illustrations by Renee Andriani

When a family brings a new baby home there are many changes. This children's book clearly explains baby's needs while emphasizing how siblings can be helpers to both baby and parents, while forging their own relationships with "the baby".

TW8287YP NEW! $12.95

EPILEPSY

The Ketongenic Diet
A Treatment for Epilepsy
John M. Freeman, MD, Jennifer B. Freeman, Millicent T. Kelly, RD, LD

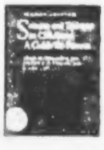
Devoted exclusively to explaining a unique doctor approved approach to minimizing seizures, this book is a must have for all families affected by epilepsy and seizures. The diet presented within is high in fat and low in carbohydrates and protein, helping to control seizures and allow children to lead normal seizure and drug free lives.

DE9390EP $24.95

Your Child and Epilepsy
Robert J. Gumnit, M.D.

This book is designed to help both patients and healthcare professionals to understand all aspects of diagnosis, and of pharmacological and surgical management. It will help parents and older children with epilepsy to participate more knowledgeably with their health care providers

DE7760EP $24.95



Seizures and Epilepsy in Childhood
A Guide for Parents
John M. Freeman, M.D.

This Second Edition in addition to providing up to date information about new diagnostic techniques, drugs, diet and surgical treatments; includes a new chapter addressing the special needs children with epilepsy have regarding routine health care.

JH4989EP $17.95

ASPERGER SYNDROME

Blue Bottle Mystery
Kathy Hoopmann

A warm, funfilled fantasy story that enables children with Asperger syndrome to read about their disability in a non threatening way that promotes the best in them.

TT978S NEW! $11.95

Asperger Syndrome, the Universe, and Everything
Kenneth Hall

The author was diagnosed with Asperger Syndrome at age eight, and now he describes some of the inner experiences and perceptions a child with autism has from a unique perspective that only one who has been through it can truly explain.

TF8300AS $11.95

Of Mice and Aliens
An Asperger Adventure
Kathy Hoopmann

Ben, recently diagnosed with Asperger Syndrome, and his friend Andy uncover an alien spaceship that crash landed in their backyard. With Ben trying to cope with his disorder, and the alien trying to cope with life on earth, adventure ensues.

MUSICAL FINGERPAINT

Musical Fingerpaint is a portable easel that can stimulate the sense of touch and provide eye-hand coordination practice for children 9 months and up. Fingerpainting is created when the child touchs the easel's special surface with fingers or one of the four included drawing tools. One of three songs plays when the surface is touched. The music and painting stop when touch is removed. The songs can also be activated by pushing a musical note button. The surface is easily cleaned by sliding the attached roller bar across it. The toy requires three "AA" batteries.

The Miracle of Life

by Lee Lipschutz

Lee Lipschutz shortly after becoming a big brother and his little sisters.

What is a miracle? I define it as a rare event that—despite any adversity—has occurred, for reasons beyond human control. The definition of a miracle can also include my twin sisters, Robyn and Ellen.

I remember walking up the steps to my house on September 18, 1986. I was 5 years old then and a typical innocent boy. As I went into the house, a feeling of solitude ran through my body. Where was my mother? There was a fading silence as the pounding of my heart became louder and faster. Slowly, as I approached the kitchen, my eyes grew wide as I found my grandmother standing there, purse in hand.

She grabbed my hand and we dashed to the car. On the way she gave me the news of which I understood just three words: Mom in hospital. At that age, I only knew that the hospital meant something bad. That was the longest car ride I had ever experienced. I felt overwhelmed when we arrived at the hospital. It was bustling with activity.

After an elevator ride and a short walk that felt like an odyssey, we arrived at my mother's room. I wondered, "Is she all right? What will I see?" I twisted the knob and slowly pushed the door open. Straight ahead, in the room, was my mother dressed in a nightgown and my father sitting alongside her. Everything seemed okay. I felt her joy as she watched me come toward her.

I really couldn't comprehend all she said, but I did understand a couple of things: I was the brother of twin sisters; they were very small and sick; and I couldn't see them yet. She also said that the doctors were not sure if they were ever going to walk, talk or eat food. A chill ran through my body. She told me that they weighed one pound eleven ounces and one pound eight ounces. I knew then that as I grew older, I would progressively understand the hardships that my sisters have endured.

Now, I can see how remarkable and miraculous their battle for survival has been. My sisters have been through eye surgery, heart surgery, brain surgery and many more life-threatening, painful surgeries. They've overcome many adversities. They have taught me that the impossible can and does happen. I admire both of them for their hard-fought battles that continue to this day. They also make me aware of how easy most of us have it. Now, I can see the other side of life with its hardships, struggles and pain met by human beings everyday.

Now ask yourself, how do you define a miracle? EP

MOM'S TURN

Beverly Roach, mother of Lee, Robyn and Ellen, writes:

Lee (now 20) wrote this as his college entrance essay. His sisters, Robyn and Ellen, were born 15 weeks early. The girls are now 15 years old and are doing well. (Robyn is in high school and also attends vocational training. Ellen attends her county's special education program.)

Many people have read Lee's essay and were touched by its sensitivity. Lee now attends Stony Brook University on a baseball scholarship.

Submit your Children's Page to: EP, ATTN: CHILDREN'S PAGE, 65 East Route 4, River Edge, NJ 07661. Be sure to include your name, address, daytime telephone number, and e-mail address! ***Now on the Web!*** We now include **Familiar Faces** and **Children's Page** on our Web site, http://www.eparent.com. Please send us your photographs with the understanding that doing so gives EP permission to put the photos on the EP Web site, exactly as they appear in the magazine and with the same text.

PEACE OF MIND

When it comes to your child, you don't compromise. Safety is indispensable. You demand quality. Reliability. Functionality.

The Lisa pediatric postural mobility system from Otto Bock gives you all this while maintaining its playful good looks. So go ahead. Take it "off sidewalk". Recline the back rest up to 130°. Accessorize to your heart's content. And enjoy how easily it folds and how little it weighs. You and your family deserve it.

For more information, visit www.ottobockus.com, or call 1-800-328-4058 to find a dealer near you.

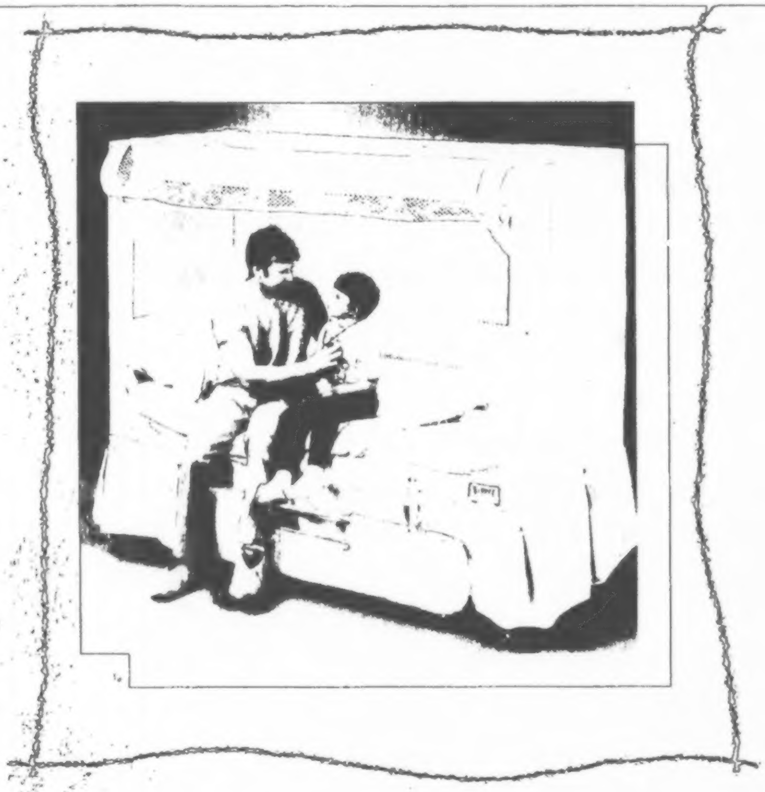
A Better Bedtime Story

The Vail Enclosed Bed



Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt. Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

Arlington, VA 22201-5704

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

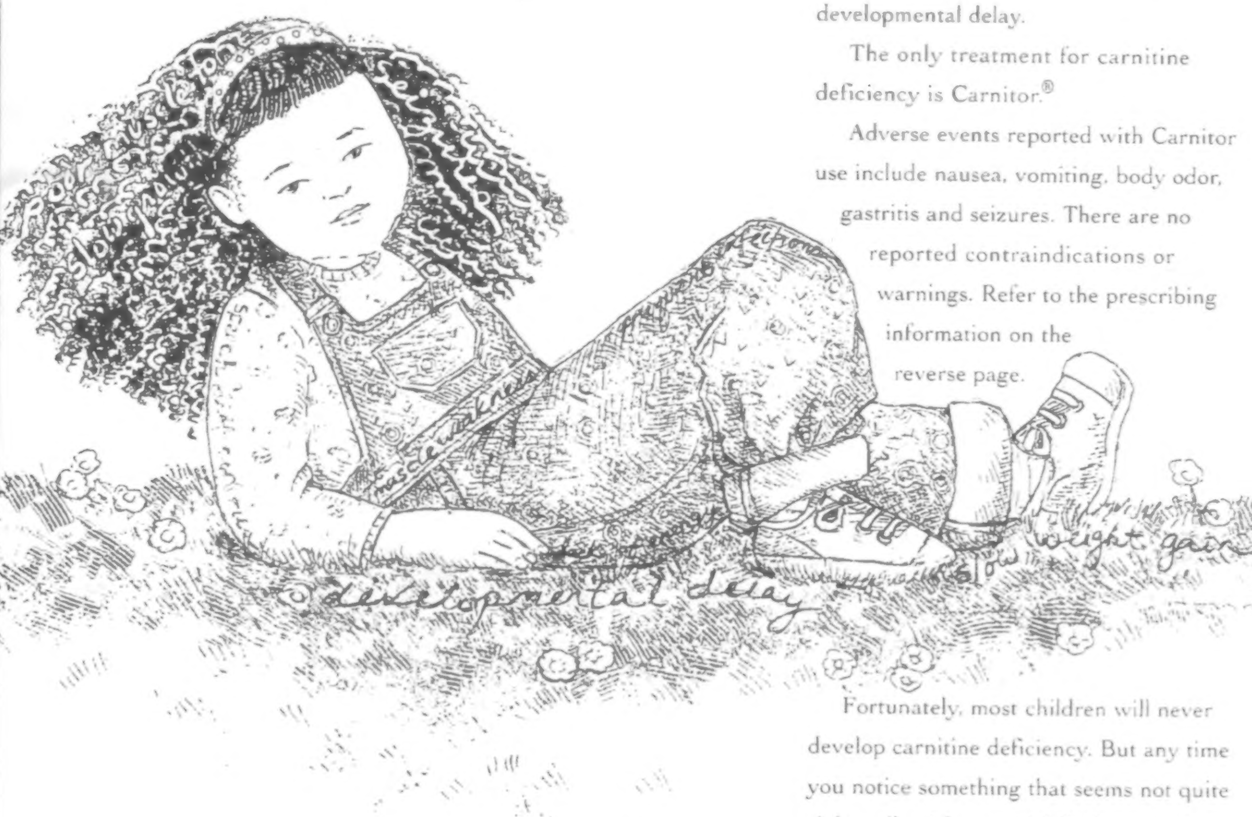
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

©2000 Sigma-Tau Pharmaceuticals, Inc. All rights reserved. PA-10

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

EVERYTHING'S RELATIVE TO EXCEPTIONAL PARENTS

I admire Einstein. Okay, I admit it; I'm an Einstein groupie. Some mornings I even have his hair. I have Einstein calendars, coffee mugs, posters, neckties, T-shirts, biographies and even a life size soft sculpture of him sitting in my office. . I have everything Einsteinium except his problem solving skills.

I've liked the guy ever since I was growing up. It's easy to like Einstein despite the fact that he was so radical a thinker that his brilliance is difficult to grasp. In addition to his theories that changed the way we look at the universe (not that I'm sure that we can actually "look" at the universe) he was dedicated to campaigning for world peace. And then there were those baggy pants and rumpled sweaters. As a guy who's lucky enough to be able to wear jeans and denim shirts to work I appreciate that as an aid to thinking about the big issues. Baggy sweaters are great to sweat out the details about the space-time continuum, the photoelectric effect and quantum theory. At my office we sweat out the details about self-determination, teaching direct support professionals the nuances of non-verbal pain expression, controlling seizures and figuring out how best to integrate dignity into incontinence. In terms of magnitude I'd match our daily concerns with his any day, Relatively speaking.

Probably the neatest thing about Einstein wasn't even true. Growing up, at least in Brooklyn, where you would periodically be reminded of your shallow skill sets in the classroom, on the ball field and especially in the movies trying to maneuver your right arm from her shoulder, you needed an identifiable icon. Someone who failed at something and moved beyond it. Some guys referenced Babe Ruth, but for me it was Albert Einstein. When I heard that he failed algebra I knew we had a connection. When I heard at age nine he spoke hesitantly I knew I had arrived. I didn't let the facts dissuade me. In reality he never failed math but he did fail the entrance exam to the Polytechnic Institute of Zurich; that was enough for me. I had to walk home with my share of papers that had "have your mother call me" scribbled in red on part of the paper. I would periodically reflect on the words from his "gymnasium" (high school) teacher in Munich, "Your mere presence here undermines the class's respect for me."

A New York Times writer captured the essence of this "balance" of nature. "Albert Einstein, so the story goes, was playing in a chamber group one afternoon, and it wasn't going well. Finally, after several false starts, the conductor turned to him and asked: "Einstein! Can't you count?" It's an endearing anecdote, one that we mortals cling to, perhaps out of wishful thinking that nature is somehow fair and democratic: surely what it gives to one man in the form of brains, it would take away in other ways. Einstein might have been the master of space-time, but here on Earth he was a naïve bumbler, the absent-minded professor. We want there to be a price for genius.

Exceptional parents know this only too well. They have countless opportunities to apply the concept, theory and reality of Relativity. To Exceptional Parents everything is Relative. They know that nature isn't fair and democratic, nor is the system we have created to address the flaws in nature always fair and democratic. They know that not every flaw in nature's repertoire has its compensation. They know that a grimace is sometimes welcome because it reflects a response. They know that a food-covered bib is compensation for the joy of oral feeding. They know better than most theoretical physicists that all things are relative in time, space and emotions. They know that while light rapidly travels around; the speed in which a physician returns a phone call is never fast enough. While Albert argued that the maximum possible speed of interaction in nature is the speed of the electromagnetic interaction, Exceptional Parents understand that the speed of interaction at an IEP meeting is slower than it needs to be. While Einstein accounted for the electrodynamics of moving bodies, Exceptional Parents ponder what it takes to get moving legislation that will provide continued support for their "aging out" children. And finally when Einstein referred to his theory of the Relativity of Simultaneity (which I think has to do with measuring time using the idea of simultaneous events) Exceptional Parents wonder why several things can't happen at the same time. Things like getting approval for ongoing physical therapy at the same time that approval for assistive communication devices should be passing each other in the mail (at the speed of the U.S. Postal Service).

Exceptional Parents understand Relativity and Reality only too well, while Einstein understood the reality of the Exceptional Parent when he observed that "Not everything that can be counted counts, and not everything that counts can be counted."

For Exceptional Parents no day is theoretical. EP

Search & Respond

S

Lip biting

My 7-year-old is delayed (1-15 translocation and partial deletion) but attends first grade and is doing much better than anyone ever dreamed she would. She finally made it to the fifth percentile on the growth chart at her 4-year-old check-up and almost overnight became obese. Her pediatrician says food is a "fixation" for her and has no real suggestions for helping her lose weight. Any suggestions would be greatly appreciated. She is VERY sedentary, loves to color and watch television. She also 'fixates' on picking scabs, picking her nose and right now has chewed her bottom lip until it looks like she has oozing fever blisters and she makes it bleed by biting it. I can make her wear gloves or socks on her hands but I don't know what to do to keep her from biting her lip—please help!

—KJ, 513, via EP Web Site

S

Wheelchair-friendly outdoor surface

My son has spina bifida and uses a manual wheelchair. We have a very large yard and he finds it frustrating that he cannot ambulate well in the grass. Has anyone used any kind of "path system" in their yard for a wheelchair that they've found works well?

—597, via EP Web site

S

Arthrogryposis and activities

My 4-year-old daughter was born with arthrogryposis and has had many surgeries, extensive PT, splinting and so on. She cannot walk, is in a power wheelchair and hardly has any arm movements. (She cannot hold, grab, nor scratch her nose.) Her orthopedist cannot guarantee us that she will be able to walk. She has no developmental delay. Are there any other parents with a child like this? If so what activities do you do in order to keep your child entertained?

—CS, 558, via EP Web site

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our Web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our Web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

Respond

R

Keeping the bed dry

SO (Feb. 2002) has a daughter with mental retardation and other disabilities who wets the bed nightly despite numerous precautions.

Our family had similar issues with my daughter who just turned 9. We found, however, that she was being "tripped" too frequently during the day and this was actually counterproductive to training the bladder to "stretch" and hold larger amounts of fluids; thus the bed-wetting. Check with your pediatrician, but bathroom trips should probably not occur more than every two hours for a young bladder, especially if she's not drinking large quantities of fluids.

—EH via e-mail

ERRATUM

In the May 2002 issue of EP, page 47 (Glossary of Movement Disorder Terms) the word "permanently" should be deleted in the definition of Botulinum toxin, as it is a temporary treatment.

Instant S&R

Hydrocephalus

S

My son is 2 years old. He was born with hydrocephalus, agenesis of the corpus callosum (ACC), arachnoid cyst, Cerebral palsy, and brain damage. He has had two fenestration surgeries (in which an opening is created) on the cyst. This cyst is almost the whole length of the right side of his head and approximately 5 cm wide. He suffers from tonic/clonic seizures. He doesn't chew and only says two words. He does sign up to 20 words. I am familiar with the hydrocephalus support groups and the ACC support groups, but I would like to speak with parents whose child has the same conditions (at least two of them) as my son. My son is going to have his third brain surgery soon.

—Maria via EP Web site

R

There is an online Arachnoid Cyst support group at http://www.egroups.com/group/arachnoidcyst.

Meet the Joneses

THE CORPS' FIRST FAMILY DISCUSS THEIR LIVES, THE IMPACT OF HAVING A CHILD WITH SPECIAL NEEDS, AND THEIR MARINES

By A.C. Strong, Sgt. USMC

LETTER FROM THE PRESIDENT AND CEO OF EP MAGAZINE

Since November 10, 1775, United States Marines have landed on the fiercest battlefields of this world. Often the first in and the last out, they have fought the fights, climbed the hills, secured positions and planted the flag. Their accomplishments are legendary and they are widely regarded as the most disciplined, respected fighting force in the world today. Because of them, we enjoy the freedom we so often take for granted to day. The term Marine conjures up thoughts of toughness, discipline and unfailing devotion to duty. But there is another, equally compelling side to the Marine Corps, and indeed all the men and women in our armed services, that is not very well understood and appreciated that we hope to shed some light on this in the following pages.

Today, the Marine Corps is headed by General James L. Jones, the 32nd Commandant of the Marine Corp. He is a man of uncompromising integrity, dedication and commitment, traits we have come to expect in all Marines. He is also the father of three sons and one daughter, Jennifer, with a profound disability. Together with his wife, Diane Jones, they have experienced first hand the daunting challenging task of parenting a child with special needs. Like all parents, we want the best for our children and the Jones's are no different.

Jennifer is thirty-one years of age and has Fragile X, a condition that often manifests itself with significant mental retardation and developmental delays. Parenting a child is a difficult task under normal circumstances. Parenting a child with special needs and three siblings gives clearer meaning to the phrase Exceptional Parent, and the General and Mrs. Jones have certainly earned that distinction. Overlay this with the duties and responsibilities of life in the military with frequent deployments, separations and relocations, and you begin to appreciate the extraordinary challenges faced by our men and women in the military, many of whom are parents of special needs children.

In this Special Report, EP focuses on the Exceptional Family Member Program (EFMP) of the United States Marine Corps. Our intention is not to stop there but in subsequent issues present the EFMP in the other branches of the Armed Forces, the Navy, Army, Air Force and Coast Guard. The EFMP is a remarkable program and there simply are no greater supporters of it than General and Mrs. Jones. In this initial segment, we hope to convey to you EP's first ever look at what one aspect of "taking care of our own" really means. We thought it was fitting and proper to begin with the Marine Corps. They are usually the first in, so beginning with them seemed the right thing to do!

One of the most well-known and striking visual images of the 20th Century is the Pulitzer Prize-winning photo by Joe Rosenthal of Marines and Sailors raising the flag atop Mount Suribachi at Iwo Jima on 23 February, 1945.

The image depicts courage, strength and honor and Americans have looked at that image for decades, recognizing it and the words of ADM Chester Nimitz, "Uncommon valor was a common virtue," as icons of that era.

During the recent inaugural Navy/Marine Corps Joint Exceptional Family Member Program conference, a medical officer used that image to illustrate the point that even some of those men needed assistance later in life for "special needs."

With a vested interest in programs for persons with disabilities, two individuals have taken their places as champions for the cause of special needs for Marines and other service members and their families – General. James L. Jones, Commandant of the Marine Corps and his wife, Diane.

The General and Mrs. Jones took time out of their schedule to be interviewed by EP magazine and its President and CEO, Joseph M. Valenzano, Jr.

"TOGETHER WE GROW" CONCEPT LINKS CORPS AND COMMUNITY SPECIAL NEEDS CHILDREN

Story by A.C. Strong and Cpl. Jose M. Montes

Special children need special support and the Marine Corps is reaching out to team with local organizations to help service families.

An example of this and the part played by its "Together We Grow" program, The Marine Corps teamed with an Oceanside, Calif., child-care provider to offer local-area military families with special-needs children a new choice for care.

Fostered by Gen. James L. Jones, Commandant of the Marine Corps, the concept of local and Marine Corps teaming has grown steadily in California and is being review at other bases throughout the world. Earlier this year, the Commandant was guest speaker at the opening ceremony just outside the Marine Corps Base Camp at Pendleton, Cal.

Located in a new 9,700-square-foot facility in the Mission Real Plaza in Oceanside, the center is the culmination of the joint efforts of Pendleton's Marine Corps Community Services (MCCS) and Special Care Inc., a San Diego-based health care company.

According to Terry Racciato, Special Care President, more than 1,100 Navy and Marine Corps service members assigned to Camp Pendleton are registered with the Exceptional Family Member Program (EFMP) and have family members with special needs.

The center offers preschool and day-care programs for both special-needs and mainstream children," said Racciato. "Serving up to 50 children at a time, program coordinators are hoping for a 50-50 mixture of children with and without special needs. The mix would boost social skills for all enrollees," according to Racciato.

This ratio "will help the special-needs child become better at dealing with life on his or her terms," said Racciato.

"The term 'special needs' covers a wide variety of medical, educational and emotional needs. The Together We Grow center addresses many of those needs, but especially focuses on the medically fragile – that being those children who need nursing care," said Linda Sheibler, Camp Pendleton exceptional family member program coordinator.

Each center is staffed by a team of teachers, nurses, occupational and physical therapists and others, to provide care for the children.

"Our goal is to make this (experience) as normal as possible," said Racciato. "So all the children learn to stand in line, wait their turn, play and paint together.

"That's the real advantage of our program. Our nursing care disappears into the background. The kids get to play."

The Camp Pendleton center is the second

General and Mrs. Jones have four children: Jim, age 34, Jennifer, age 30, and the twins, Greg and Kevin, age 27.

Jennifer, born in 1971, was diagnosed with Fragile X Syndrome.

Fragile X is the most common inherited cause of mental impairment, affecting one in 2000 males and one in 4000 females of all races and ethnic groups. It is caused by a defect in the gene called FMR1. In individuals who have Fragile X Syndrome, a defect or mutation shuts the gene down. This makes it impossible for FMR1 to manufacture the protein that it normally makes. Fragile X is also associated with a number of physical and behavioral characteristics.

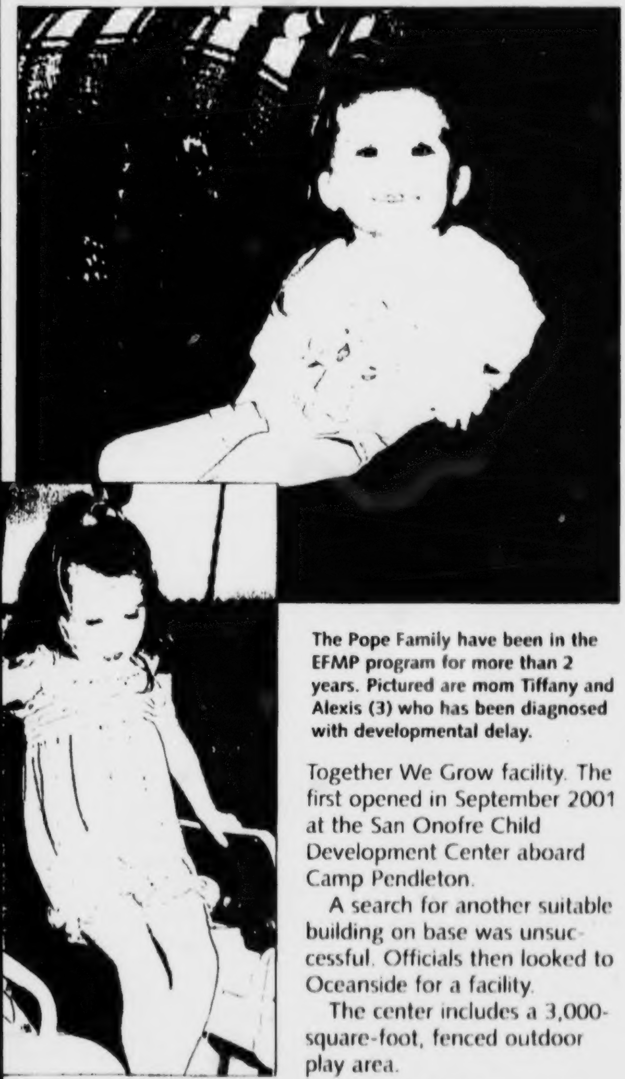
However helpful that may sound, it took years before the Joneses received that confirmed diagnosis. It wasn't until 1985, that the doctors were able to assess the years of information.

In the beginning, like most parents who face the challenges of a child with special needs, the Joneses just knew that something wasn't right.

Mrs. Jones was the first to notice Jennifer's symptoms and the lack of milestone-accomplishment.

Diane: "Jennifer was born with a partial cleft palate. She could still eat and drink. She just didn't seem to react

Continued on page 20



The Pope Family have been in the EFMP program for more than 2 years. Pictured are mom Tiffany and Alexis (3) who has been diagnosed with developmental delay.

Together We Grow facility. The first opened in September 2001 at the San Onofre Child Development Center aboard Camp Pendleton.

A search for another suitable building on base was unsuccessful. Officials then looked to Oceanside for a facility.

The center includes a 3,000-square-foot, fenced outdoor play area.

Each of the four rooms in the new Together We Grow center was named in honor of a child with special needs. One room, named "Jennifer's Jungle Safari Room," is named after Commandant of the Marine Corps, Gen. James L. Jones' daughter.

Jones told the audience about his life and the challenges of living with, caring for and nurturing a child born with a disability.

"When she was born in 1971, it was too difficult," said Gen. Jones. "I was a young captain then. I knew there might be programs out there for our situation, but I did not make an effort to find out.

"I looked at it as a situation my family should deal with by itself. I didn't want the Marine Corps to feel sorry for me."

Jennifer, diagnosed with Fragile X Syndrome, a disabling chromosome disorder, now lives in a group home near her family in the Washington, D.C., area.

"Don't do what I did, because you don't have to," said Gen. Jones. "It's not going to count against you to help your children gain their full potential."

At a recent speaking engagement in California, Mrs. Jones reiterated the point, "It doesn't matter what your label is, or what the disability is, everyone needs some type of support."

General Jones said caring for a child with special needs is an exercise in character building.

"I'm a better person for the experience of being the parent of a special-needs child, and our family is a better family for it," said Gen. Jones.

A third center, still in the planning stages, is to be built in Temecula, Calif. It is hoped that this will offer more options to service members in the surrounding area.

"We're hoping that with a triangle (of centers) around Pendleton, we'll be relatively accessible to the families coming into the base," said Racciato.

The EFMP is a mandatory-enrollment program designed to assist Marines and Sailors by addressing the special needs of their exceptional family members during the assignment process and to assist families in obtaining necessary care and assistance. Information about the EFMP is available on the MCCS Web site at: http://www.usmc-ccs.org/perssvc/efmp/efmp_main.html.

HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas

The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

> *"We deceive ourselves when we fancy that only weakness needs support. Strength needs it far more."*
>
> — Madame Swetchine, 16th Century author.

continued from page 15

to sounds and perceive that you were talking to her, or make eye contact. We had only one other child, who was three years older. Then, at about her 6 months checkup, one of Jennifer's doctors said she had a sixty-five percent chance of mental retardation.

"I had a hard time dealing with it, especially the part about being a 64% chance. I was struck by the precision and imprecision of it all." We tried all the different hospitals – Bethesda, NIH, Johns Hopkins—and basically no one ever really made a diagnosis."

"The amazing thing was, in the beginning, I was devastated and Jim was very much in control. The expectations that were given to us were that she would never walk or eat," Gen. Jones said. " They told us she will never feed herself," Diane added. "It was suggested that we put her in an institution. General Jones quietly said "We simply refused to do that."

"I would not ever entertain the notion of 'never,'" Gen. Jones recalled. "They told us she would never do this, never do that—and she did them all."

Still young by Marine Corps standards, then Capt. Jones and his family struggled to make sense of the doctors' impression that the Joneses were in denial because they refused to place Jennifer in an institution.

Diane: "One of the reports that came back from Hopkins said 'the father (Jim) is having a hard time dealing with this,' said Diane. 'They wrote him up like he was floundering, but he was actually the one who was like a rock.'"

Gen. Jones: "They said I was in denial. For every time they said she wouldn't be able to do something, I said 'but she already is doing it.' There was no question in my mind that I couldn't part with this child." Diane: "Yes, and here was this positive attitude that we will not institutionalize this child."

In 1971, pre-dating 1975's Individuals with Disabilities Education Act (IDEA) and 1990's Americans with Disabilities Act (ADA), Jones didn't know if there were programs available to assist his family and didn't want anyone to feel sorry for him, so he and Diane pulled together and faced obstacles as a strong family unit.

Gen. Jones: "But we floundered. We were really novices and there were no programs we were readily aware of."

Diane: "Yes, it was all new."

Gen. Jones: "There wasn't much in the military and we are talking the 70's here. They were reactive, but they weren't proactive. (However) the early intervention people were proactive with us."

Both General and Mrs. Jones are strong advocates for early intervention programs. "There is no question but that they work."

The family moved from Maryland to Fairfax, Va., because Fairfax County had just started Infant Stimulation/Early Intervention programs and 1-year-old Jennifer started the special programs and preschools that were available there.

Diane: "He is right. There really was nothing in the military," said Diane. "It was all new, even in your county and local states. Because of Public Law 94-142, they were just getting into infant stimulation and all the other interventions. You didn't have great niches and other people around that could refer you to an agency or something."

Gen. Jones: "Absolutely."

Diane: "That is why the Exceptional Family Member Program is so important. I think it is important now to expand beyond—to have a support resource for Marines, because that's our family—our military family."

"But you asked how it impacted us as a family? Well, Jim would go out into the community and never be concerned with people who would stare or youngsters who would just point. I, on the other hand, had a very difficult time. It broke my heart; it was just the pain of it. I am, after all, a mother. I couldn't understand people referring to her as 'retard,' or staring or glaring."

Diane: "I thought this was the way the Lord said, 'Okay,Jennifer is your kid. Go back into special ed.' So I went back for my graduate degree in special education." Gen. Jones added: "While I was overseas for a 13-month assignment."

With four children under the age of six, Diane relied heavily on her own strength and the assistance of her parents who were nearby. Gen. Jones: "When I went overseas I was a Captain, and in those days, as you recall, tours of duty in the Marine Corps were 13 months long. The Marine Corps let me stay home through the first—we had a complicated birth, so they let me stay home for 90 days after the twins were born. When I left, our oldest son was 6, Jennifer was 3 and the twins were 3 months old, and Diane went

Continued on page 22

THE CHANGING FACE OF MILITARY LIFE

Napoleon once said, "Soldiers win battles and Generals get the credit." What he didn't mention, however, is that most soldiers and generals have families who are affected by military life.

This is especially true today. Two decades after becoming an all-volunteer military, 55% of all service members are married and have over 1.2 million children. The majority of children (73%) are 11 years of age or younger, with 39% below the age of six.

This profound demographic shift portends greater diversity of family structures, each with unique stresses and needs. The number of single parents is 6% of all personnel, up from 3.7% in 1989. One significant consideration is that today 20% of female service personnel are in joint service marriages as compared to 4% for male personnel. Overall, women represent about 15% of the entire military population.

TODAY'S MILITARY FAMILY:
Today's military family faces a lifestyle that comprises a higher operations tempo as well as more frequent deployments and thus increased family separations as the result of more frequent relocations and more varied types of military assignments and missions. These factors create stresses and challenges for families that, if they are not able to be managed successfully, can impact on readiness.

Dual military families and single parents face issues that require additional planning. This is especially true if they have a child with special needs. At present, there are 34,732 dual military couples with children and 83,564 single parents in the military. The planning, child care arrangements and emotional issues regarding these military children gained national attention in the Persian Gulf War when, for the first time in U.S. history, both mothers and fathers deployed.

Today, the military community must have the objective of strengthening local resources as a major focus. Coordinated, community-based efforts are needed to support families as the nation's defense budget and the ranks of military personnel decline.

ISSUES AND CHALLENGES:
The principal issues faced by today's military family may best be summarized as follows:

- ☆ New missions, plus the added threat of global terrorism, translate into an added workload on an already overburdened force that is stretched across all continents.
- ☆ Higher family stress, especially if that family has a child with special needs.
- ☆ Specialized technical skills are in constant demand and short supply.
- ☆ An increased reliance on military reservists with specialized skills.
- ☆ Both mothers and fathers and joint deployments must be dealt with when considering families caring for children with special needs.

TAKING CARE OF OUR OWN:
The military, especially the Marine Corps, prides itself on the time-tested tradition of taking care of its own. And well it should. They do take care of their own and they do look out for each other. But the increased stresses mentioned earlier will place an expanded burden that will require the military to think a bit outside the box and focus on greater community involvement. Members of the military will need to seek greater access to quality information that can help their families cope with the challenges of raising a child or children with special needs.

The military can and should be viewed as an extended family. Ask any Marine, on active duty or not, and he will likely respond in the present.... "I am a Marine". The military does for its dependents what all good families do; it functions as a special type of family, a unique group of people who love, care and support one another.

The functions of a family include educational, recreational, emotional and economic support that is reinforced by a sense of pride and strength in caring for each other. Fortunately, inside our military, there exists the Family Support System of the DoD and it provides a spectrum of services that help military families cope with the issues and challenges they face in this fast-paced, ever-changing world. Among the issues addressed by the Family Support System of the DoD are the following:

- ☆ Relocation Assistance
- ☆ Transitioning to a Civilian Career Assistance
- ☆ Personal Financial Management
- ☆ Exceptional Family Member Program Services (EFMP)
- ☆ Spouse Employment Assistance
- ☆ Chaplain Assistance
- ☆ Emergency Financial Aid
- ☆ Medical and Dental Services
- ☆ Information & Referral Services
- ☆ Child & Youth Services
- ☆ Support During Duty Separation
- ☆ Mental Health and Substance Abuse
- ☆ (Pre-Deployment, Deployment Services and reunion Support)
- ☆ Family Life-Skills Education
- ☆ Recreation & Fitness
- ☆ Volunteer Resource Management
- ☆ Primary & Middle Schools
- ☆ Health & Wellness Centers
- ☆ Family Advocacy

MARINES' FIRST LADY

EXCEPTIONAL FAMILY ADVOCATE

As First Lady of the Marine Corps, Diane Jones has been instrumental in improving the quality of life for all Marines. She has been especially concerned about Marines whose family members are in the Exceptional Family Member Program. Mrs. Jones helped to create the Marine Corps Family Readiness Committee as a voice and advocate for all the family and volunteer programs.

During the past three years, she has fostered a Committee for Persons with Disabilities comprised of family, base and community representatives on every major Marine Corps base. This attention to support services and private partnerships has resulted in improved accessibility, childcare, respite care and recreation options. A private fund was established to assist families in affording equipment and services otherwise not available to Marine personnel and their families.

When the Department of Defense steering committee held its first summit this year to explore ways of standardizing this program throughout all the military services, she was an active participant.

Besides testifying before the House Committee on Education, she has served as guest lecturer at numerous graduate programs.

The mother of four, including a daughter with fragile X syndrome, Mrs. Jones holds a BA and MA in Special Education from George Mason University.

continued from page 21

back to graduate school. If it hadn't been for her parents, we never could have done it."

Aware that whatever she was feeling she would project to her children, Diane was as careful as possible. However, a parent cannot be a permanent shield. So all four children shared in the responsibility, the joy and the pain.

Diane: "It became incumbent on them to pick up more responsibilities. From early on, I would need help with this or that. We had many emergencies with Jennifer, which would have us rushing to the hospital in the middle of the night." But our sons always treated Jennifer like anybody else. I am sure that when people would stare or make fun of her, it broke their hearts."

Gen. Jones: "They were pretty strong."

Diane: "They are very strong."

With all the responsibilities, the boys were never jealous of the attention that Jennifer received. They just pitched in where they were needed.

At the age of three, Jennifer developed a mysterious illness that caused her to vomit for no apparent reason. According to Gen. Jones, doctors at the National Naval Medical Center, Bethesda, Maryland could find nothing. They ran tests, and even did several surgical procedures which solved nothing.

The boys were in an environment in which their sister was being taken to the hospital regularly and they were under stress.

Diane: "...The positive side is as long as the boys were in school, whenever we would go in for parent-teacher conferences, they would always say the same things about the boys – always very kind and thoughtful to others. They always were. Even though they were class leaders and athletes in their own right, they always reached out to the kids who weren't included to make them feel as if they belonged. They have always been very protective of people who aren't quite as big, aren't quite as fast, aren't quite as included in the main group. We have always attributed that to the fact that they have a sister who is special. They learned some of life's valuable lessons early on and it has paid off for them."

The family has gained the ability to carry over their personal strengths and give back to the community. However, Gen. Jones wasn't always as confident in how to deal with the challenges.

Gen. Jones: "Well, let's be real clear about this. I am an example of what not to do. I did that when I was a young officer; I had the impression that this (Jennifer) was my problem, our problem. I didn't want special treatment and I certainly did not want my career jeopardized because of my own family problem."

"It wasn't that I was embarrassed. Obviously, I have not been. I am very proud of Jennifer and happy that she is a part of our family. The issue was that I wanted to stay on in the Marine Corps. I wanted to seek the same experience that all my peers had. I wanted very much to be a company commander. I very much wanted to be a battalion commander. I felt whatever difficulties we had in the family we would, WE would fix them."

"I resisted offering myself up as a candidate for any kind of special assistance. I am like any other Marine... I did not want any special privileges. The EFMP is a command registry program, it's not a support program."

In the past, the EFMP wasn't promoted. Enrollment in the program is mandatory under Marine Corps Order P1754.4A, but some service members avoid enrolling in the program because of common misconceptions such as "I won't be able to re-enlist." Or, "My career will be flagged and I will not have promotional opportunities"

"Our way of life can be challenging

and stressful to our families," said Gen. Jones, in a white letter dated Jan. 25, 2001. "This is particularly true for families who have special needs such as severe medical conditions or special educational learning requirements."

In the letter, the Commandant directly charges Marine Corps leadership to recognize and emphasize their roles to create an informed and understanding environment. He says, "Leaders, at all levels, need to not only be aware of EFMP, but actively refer Marines."

"Misconceptions and concerns continue to be pervasive about the EFMP as it relates to a Marine's career progression. Your help is needed to spread the truth and dispel these perceptions," said Gen. Jones to Marine Corps leadership.

The program is based on a number system, one through five, five being the families with the most impaired individuals, who are not all children. Spouses and parents also make up a good percentage of the numbers.

Diane: "They represent the same percentage that the regular (civilian) American society would be. Therefore, there was no reason on earth for our people who go overseas - a young Marine who wants to deploy - and be told there are no services for the disabled. We did the same thing. Jim went overseas all the time. I chose to stay back because of Jennifer's medical needs, not knowing that that's what really would have happened in the program anyway in those days.

Gen. Jones: "I will give you an example of the higher end of things. We have a command selection process in the Marine Corps and the last couple of years one of the colonels was selected for a command in Japan. Through the screening process, we found out that his wife is allergic to a certain type of shot that is given to anybody who goes for duty in Japan to prevent contraction of a disease that is prevalent in Japan. She can't take the shot medically. Now in the old days, we probably would not have known that. Now that we do, we are able to talk to the family and say, 'Look medically this is dire. You need this shot because the probability of contact is pretty high. Either way, if you don't have the shot or if you take it, you are putting yourself at great risk.'

Without changing the colonel's orders, we just moved him from Okinawa to another similar command in North Carolina.

That's the kind of participatory relationship we want to have so we can allow Marines to continue their careers without fear of any kind of a stigmatization and without fear of being treated 'specially.'"

General Jones believes that there is always another way to work around (problems) and it doesn't have to make anyone feel sky-lined, guilty or different.

Gen. Jones: "We have all kinds of different needs. Sometimes it's not associated with disability. Sometimes it's an elderly parent who would not be able to survive without a family member somewhere close by on the Eastern seaboard. If we can do that for our people, we should do that."

Diane: "One of the things, piggy backing on that, is our Committee for Persons with Disabilities and access to care and information on our bases. We discovered this committee very early on at Camp Lejeune in North Carolina, started with parent advocacy and parent initiative. We were so impressed because what that did was bring base representatives, the families, the people with disabilities themselves and the community together. This committee was even organized with bylaws and was not a gripe session. It offered an opportunity for all to share issues, concerns, best practices, etc.– anything and everything that warranted attention. Even accessibility was brought up. As a result, we (the Marine Corps) have implemented this committee in some format on all our major bases and stations.

"What has it done? To name a few innovative results, we now have beach wheelchairs, handicap accessible pontoon boats, adaptive pool lifts, handicap accessibility to buildings, parking and also, outside of accessibility issues, supports such as therapeutic recreation, childcare, and respite care—those things that allow individuals to have normal lives."

Continued on page 24

EXCEPTIONAL FAMILY MEMBER PROGRAM (EFMP)

WHAT IS IT?

The Exceptional Family Member Program (EFMP) is designed to provide assistance to active duty personnel with family member (s) who have special needs before, during and after relocation due to Permanent Change of Station (PCS) Orders.

An Exceptional Family Member is an authorized family member (spouse, child, stepchild, foster child or dependent parent) residing with the sponsor who may require special medical or educational services based upon a diagnosed physical, intellectual or emotional need. This includes conditions such as asthma, cerebral palsy, mental retardation, dyslexia, ADD/ADHD, autism, oppositional defiant disorder, depression or other rare disorders. Disabilities may range from mild to severe.

BEST COPY AVAILABLE

continued from page 23

The EFMP provides program coordinators at each base and station to manage and monitor the assignments. They themselves become informational resources. They work with the community to access outside assistance for partnership support. This is evident in programs such as "Together We Grow" at the Marine Corps Base Camp Pendleton area. (see accompanying story)

Gen. Jones: "The Marine Corps has 15 major bases and stations around the country. Virtually all of them have strong relationships with the local communities. In many cases Marines either retire or leave service and stay on. So the relationship between the community and the bases not only encompasses careers, but continues after them.

Diane: "We can't be in this box anymore. You have to look at alternative options and they are not all options that require the military to provide everything, but they are partnerships and agreements."

An illustration of this is another issue involving the community and the service member: military housing and the public/private venture. Historically, there never seems to be enough housing. According to the Commandant, under a new program which he has spearheaded, the Marine Corps is now contracting with builders provide the housing and maintain the property and is paid "rent" out of the Marine's basic housing allowance. This will provide more housing availability, including ADA compliant units.

Diane: "The public/private venture is so key because I believe we could do the same in child care. That's my goal."

"This is another aspect that is important too. The Corps has a single Marine program and the irony is, the perception is one of single Marines who are all young corporals out on ships. Today you have divorcees, widows and widowers and you have single parents with special needs program requirements. The entire structure of the armed services has changed versus what things were like twenty years ago."

Programs are beginning to shape up on bases and stations which provide for that specific need, and EFMP coordinators have access to information about community and respite opportunities.

General Jones' Brilliant Career

General James L. Jones attended Georgetown University's School of Foreign Service graduating with a B.S. Degree in 1966.commissioned a second lieutenant in the Marine Corps, he was sent to the Republic of Vietnam, serving as a Platoon and Company Commander until June of 1968.

He rose steadily through the ranks of the Marine Corps, attending the National War College, serving as Military Liaison Officer to the United States Senate, and Commanding General, 2d Marine Division. He was assigned to the Office of the Chief of Naval Operations, Military Assistant to the Secretary of Defense and now is the 32nd Commandant of the Marine Corps. General Jones' decorations include the Defense Distinguished Service Medal; Silver Star medal; Legion of Merit with Four Gold Stars; Bronze Star Medal with Combat "V" and the Combat Action Ribbon. He has also received the S. Robert Cohen Annual Achievement Award given to the person who "best exemplifies the spirit of the Jewish Foundation for Group Homes and its commitment to independent living"

Gen. Jones: "I think, fundamentally, what we are trying to do is gain knowledge and support from the community and recognize that there are a lot of people who can help our Marine Corps Family. However, what we are talking about is serving the group that needs special focus on that".

Diane: "That's what you (EP) do. You help make people aware of new technology, new treatment options, etc., and our Marine Corps family needs access to this kind of information as much, if not more, than the families who currently subscribe to your publication. I'd like to see EP on every Marine Corps Base in the U.S."

"It's a fact of the human condition. We all need help at some point. But it often holds out great benefit to us and the nation. If we invest a lot of money training these young Marines, hopefully the best will stay with us. Then it is incumbent upon us to try to do those things that can help them fulfill their potential as Marines. It is also the right thing to do!"

Diane: "In the military, we have programs for counselling, religious services, domestic violence, physical fitness, education, spousal employment – all under the umbrella of family readiness. We have them all. If you just expand this program just a little more, it fits the whole description.

"We were able to establish a Family Readiness Committee which represents family programs and acts as a voice and advocate for them, to include the Exceptional Family Member Program. It comes down to this: we have young people joining the Marine Corps and we want to keep the majority. So you offer them the best you can that allows their families to have a normal life."

And, as with all families, "normal" is different for each. The Jones family just happens to encompass several thousand Marines. EP

The National Fragile X Foundation

By Jeffrey S. Cohen and Robert M. Miller

Established in 1984, The National Fragile X Foundation unites the fragile X community to enrich lives through educational and emotional support, promote public and professional awareness, and advance research toward improved treatments and a cure for fragile X syndrome.

BEST COPY AVAILABLE

Fragile X syndrome is the world's leading cause of inherited mental impairment and the community of individuals touched by fragile X is as diverse as it is large. Nearly 1 million families in the United States are touchedby fragile X, either as carriers or affected individuals. Worldwide, the number is a staggering 20 million people. The fragile X community encompasses individuals from every country, race, religion and ethnic background.

Tracey (left) and Mikayla (right) share mother and daughter smiles

The diagnosis of fragile X syndrome cannot predict the future of the child. Individuals with this single-gene disorder function across a broad spectrum of intellectual, social and emotional levels, from normal to mildly impaired to profoundly impaired. Although the diagnosis is made with a simple blood test and can even be made in utero, the degree of a child's impairment and his or her future success cannot be

continued on page 28

continued from page 27

predicted. There are individuals who are technically only carriers but seem to be significantly affected, while others, who are by definition "fully affected," function at a fairly typical level.

Since the National Fragile X Foundation (NFXF) is often a family's first stop in their quest for answers, we strive to provide the educational and emotional support so critical to surviving this trying time in the life of a family. Person-to-person support is a toll-free phone call away (see contact information on page 30) and in most states other parents and knowledgeable professionals are organized by the Foundation into resource groups, Centers and parent contacts who can provide personal support. The most common message provided to families by the staff of the Foundation and by the parent support network, is that with the proper intervention their children can be participating and contributing members of their families, schools and communities. As obvious as this may seem to those in the professions of special education and therapy, it zeroes in on the deep anxiety that many parents feel about their child's future. The Foundation provides resources to meet the needs of families confronted with the reality of fragile X such as books, pamphlets, newsletters, videotapes and a web site. Not only are these materials filled with the science of fragile X and its medical treatment, but they also offer everyday, practical advice.

Because so little is known about fragile X within the broad medical, educational and public communities, the National Fragile X Foundation works to increase public and professional awareness. Television public service announcements (PSAs) are distributed to stations across the country. Recently, a truck-driver from Texas learned about us after receiving a call from his wife who excitedly told him about the Foundation's affiliated parent support groups in their area after viewing our PSA and learning that she was not the only one in the world who had a child with the syndrome. Educational resource materials are published to help both parents and teachers successfully educate children with fragile X along with their non-affected peers. The Foundation is currently completing the first year of a two-year education project to create a classroom lesson-planning guide designed to help teachers improve inclusion of children with fragile X in their classrooms.

The family shares there love with a hug. Pictured from Left to Right are Tava (10), Tracey (Mother), Olivia (17), Mikayla (7) and David (Father)

Crucial to the Foundation's mission is its biannual International Conference. The National Fragile X Foundation is holding its 8th International Fragile X Conference in Chicago on July 17-21, 2002, with approximately 700 parents and professionals expected from more than 20 countries. Leading scientists from around the globe will gather to share their findings and challenge each other to do more, find more and help more. These conferences are designed to bring together the leading minds in the fields of medicine, molecular biology, genetic and mental health counseling, occupational therapy, speech and language intervention, and education with parents, families, direct support professionals individuals with fragile X.

The NFXF's International Conferences strive to create a climate where members of the fragile X research community take a more collaborative direction and where small, incremental steps are shared with colleagues in the advance towards more effective treatments and an eventual cure. Best practices for teachers, speech pathologists and occupational therapists are also featured, making these conferences truly one-stop, cutting-edge resources for all concerned with fragile X.

Perhaps the most enriching results of their international conferences are the lifelong friendships established among the families and professionals who share the bond of fragile X. Members of the research community are particularly motivated in this quest by the personal relationships they establish with families during these conferences. Like many of the challenges faced in life, the challenge of fragile X is better met when those it impacts band together to support and learn from one another.

It is this challenge that drives the third focus of the Foundation: to advance research seeking improved treatments and a cure for fragile X syndrome. The Foundation supports research on different types of therapy —speech, occupational, behavioral— and best educational practices. Fully understanding the promise that the Human Genome Project holds for the eventual cure of many genetic conditions, the Foundation also funds promising scientific research. Fragile

continued from page 29

X is seen by many in the research community as a "portal" condition, based upon the widely-held belief that unlocking the secrets of fragile X will lead to breakthroughs in the understanding and treatment of many other similar and related conditions. In an effort to attract new, young researchers to this exciting field, the Foundation provides summer fellowships for students working with established fragile X research programs.

Medical Aspects of Fragile X Syndrome

Fragile X syndrome is the most common genetically inherited form of mental retardation currently known. In addition to intellectual disability, some individuals with Fragile X display common physical traits and characteristic facial features, such as prominent ears.

Children with Fragile X often appear normal in infancy but develop typical physical characteristics during their lifetime. Mental impairment may range from mild learning disability and hyperactivity to severe mental retardation and autism. This genetic syndrome is caused by a defect on the X chromosome. Because of scientific advances, improvements in genetic testing and increased awareness, the number of children diagnosed with Fragile X has increased significantly over the last decade.

Scientific research efforts must include not only private funding but also government funding in order to succeed. The Foundation is a member of the Coalition for Children's Health (CCH), an advocacy group based in Washington, DC, that promotes a wide range of children's health issues. Through the CCH, the Foundation participates in efforts to educate members of Congress about fragile X and urges them to increase funding for research and treatment. In 2000, the NFXF participated in an effort which culminated in the passage of a landmark law known as the Children's Health Act of 2000. This Act provided funding for research into a wide range of conditions affecting children's health, including fragile X, and the establishment of three fragile X research centers. Another noteworthy accomplishment in 2000 was the proclamation by Congress declaring July 22 as National Fragile X Awareness Day.

These accomplishments are made possible by the generous and enthusiastic support of the worldwide community of fragile X families and professionals. While similar in many ways to other disability groups, the fragile X community is unique in its struggle to raise awareness of this common yet little-understood condition.

It is the enthusiasm and determination of parents and professionals to make a difference in the lives of children and adults with fragile X that drives the National Fragile X Foundation in its efforts to educate, raise awareness, promote and support research and provide timely, meaningful, relevant resources.

Jeffrey S. Cohen is the president of the National Fragile X Foundation, and Robert M. Miller is the Foundation's executive director.

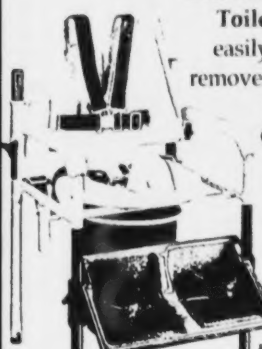
Sharing the Caring

Sally, 40 lbs. and 45" tall, in the #8600 Reclining Bath Chair with #8875 Head Pad

Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child – *with comfort, safety and ease!*

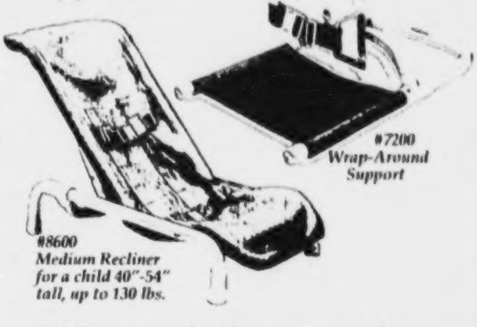
You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

☐ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.



#5800 Hi-Back Positioning Commode for junior adults

☐ At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child – and you – to enjoy the bath.



#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

☐ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.

#2000 Car Seat

Why do these products work so well?
Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

INDEPENDENCE for Teens During Summer Break:

Techniques to Reinforce Life Skills at Home

By Carolyn O. Cantu, MS, OTR

Summertime...

In most homes across America, the relaxed summer months are time when young people tend to forget the skills they learned during the school year. This is often the case with independent living skills acquired by exceptional teens. A natural reaction occurs: the more independence skills slide, the more parents tend to pick up the slack. All too often, summer is draining for parents and boring for teens. To prevent this situation, parents can adapt special-education and therapeutic techniques to the home environment. These strategies can be an effective means of reinforcing independent life skills learned during the school year, maintaining hard-won gains.

How the pros do it

Throughout the school year, special educators and therapists commonly use daily routines, high structure, organization, visual and auditory prompts to teach life skills and reduce inappropriate behavior. Though the list may vary from state to state, and even among school districts within a state, life skills are often categorized for presentation by domain: self care/personal care, home living, social/communication, community-based instruction, vocational, functional academics, recreation and leisure. Behaviors such as impulsivity, lack of initiative, inability to complete tasks, memory difficulties, distractibility, disorganization, stress and anxiety interfere with independence skills in both classroom and home environments. The process of reducing the influence of such behaviors and promoting independence involves two distinct steps: analysis and synthesis.

Activity Analysis

Activities and how they are performed must be evaluated before life skill strategies can be applied effectively. School-based occupational therapists and special educators identify which component(s) of a functional or academic activity is a stumbling block in a student's path to success. The Material, Process, and Product Analysis is one of the easiest methods for activity analysis to adapt for home use. Selected from many methods taught in occupational therapy curricula, this design is particularly simple, quick and effective for parents to modify.

An example of a self-care activity analysis

Category: food preparation. Activity: making a peanut butter and jelly sandwich and glass of milk for lunch.

Material Analysis (items needed for task to be completed): jars of peanut butter, jelly (or honey), bread, work surface (eg, a cutting board), plate, knife or spoon, napkin, glass or plastic cup and milk.

- What materials are necessary to accomplish this activity?
- Are they familiar to the teen?
- Are ingredients and materials easy to locate and transport to the preparation area?
- Are visual prompts needed for the teen to locate the materials independently?
- Are any utensils needed that are potentially dangerous?
- If so, what does the young person already know, what needs to be reinforced, and what information needs to be added?
- Is there any substance or material in this activity that causes tactile defensiveness in the teen, resulting in refusal to touch the materials or substance? How can the activity be adapted so that it can still be accomplished even with this substance/material?

Process analysis (steps the teen must execute in sequence to complete the sandwich):

- Is the teen familiar with the location of all ingredients and utensils?
- Can she or he walk or wheel to the location, open the cabinet or drawer, and reach and gather the necessary items?
- Are visual prompts (pictures of utensils or written labels of items) needed as location reminders?
- Can the teen safely transport items from the refrigerator, cabinets or drawers to the preparation area? If not, what assistive devices or equipment (eg, a rolling kitchen cart) may enable independence?

- Does the teen have the grasp and dexterity necessary to open jars, manipulate the spoon or knife to remove the peanut butter and jelly and to spread them on the bread?
- Are stability devices, such as non-slip matting under the plastic cutting board, necessary?
- Are sequence prompts necessary? Verbal prompts might be: "The bread is in the package. We need two slices for the sandwich. How do we get what we need out of the package? What do we do with the bread now? Here is the peanut butter jar. What comes next?"

Product analysis:

- What was accomplished?
- Which skills were practiced and achieved independently? Which needed assistive devices or equipment?
- How many prompts were necessary? What type were they? Is it possible to minimize them during the next meal preparation?

The results: Self-made peanut butter and jelly sandwich, self-esteem boost, independence in self-care activity reinforced.

Performance analysis:

Over the years, special education teachers, therapists and researchers have identified those behaviors that commonly reduce effective performance of life skills. Analysis of such behaviors is ongoing by therapists and educators as their students participate in each school activity. Parents may also engage in this analytic process as they observe their teen's behavior in summer activity. Here's how. Consider to what degree these characteristics may impede life skill performance:

- Lack of initiative: teen seems to need someone else to initiate an activity idea.
- Lack of or delay in planning and sequencing: difficulty with sequencing movements or "think it through" steps to finish an activity.
- Decreased attention, distraction, or daydreaming: teen moves from one task to another without completing the first. Seems distracted while instructions are given and does not follow them completely.
- Difficulty with transitions from activity to activity. Seems agitated or becomes loud before, during or after changes, whether in location, activity or time.
- A tendency to fatigue often or tire easily. Teen lacks enough energy to complete one activity, even if it is a favorite.

> Activities and how they are performed must be evaluated before life skill strategies can be applied effectively.

- Disorder, clutter: items left around, not put away (eg, clothes strewn from attic to basement; sports equipment and parts of games scattered throughout the house).
- Difficulty remaining seated for an activity, squirming or fidgeting.
- Lack of safety awareness or possible consequences

It is important for parents to keep in mind that activity analysis should not be separate from the family's daily routine. Rather, including the teen during such routine family activity as meal preparation, and facilitating participation with minimal prompts, encourages competence and independence. The same principles may be applied to household tasks such as laundry, outside chores or general household cleaning. Include the teen in one or more activities that are components of the overall job. After analyzing three activities—one in the kitchen, one in the bedroom or family room and one outside in the yard—parents will become adept at using the Materials, Process and Product analysis on the fly to apply techniques that will promote independence in the home.

Activity Synthesis

Synthesis pulls together practical strategies applied to characteristics and behaviors across all life skill domains. As these strategies start to work with the teens, they will experience a sense of accomplishment and independence they can carry with them when vacation is over and the next school year begins.

Suggested Strategies for Bridging the Summer Gap

Once they become practiced in analyzing their teen's activity and performance, parents need strategies that encourage their teen's independence in the home and community. Techniques used daily by teachers and therapists can enhance the teen's ability to focus on and complete functional skills necessary in daily living. Most strategies are common to all domains and may cross over from one to another.

General Strategies:

- Break each activity down to its smallest components. Use pictures, lists, charts and verbal prompts as needed for completion.
- Keep charts and lists simple and uncluttered.
- Reduce the complexity of an activity and the length of time it takes to complete a task.
- Use simple, concrete instructions.
- Remember that young people with

continued on page 34

continued from page 33

memory difficulties may require many verbal or visual repetitions of the steps in an activity.

- Give a "pat on the back" for successful task accomplishment or participation.
- Prepare for transitions. Use a timer set for five minutes or another auditory prompt before a change of activity, preparing the teen for a change such as "When the timer on your watch goes off, we'll get ready to go swimming."
- Provide a sense of external order. Put pictures or written labels on drawers of clothing. Hang like items together in the closet: shirts with shirts, for example, and pants with pants. In the kitchen put pictures or written labels of the contents on cabinets and drawers.
- Plan activities out beforehand, especially those outside the home. Make a trip to the location before an event—say, a birthday pool party—and review the potential dangers.
- Use calendars, charts and lists of planned activities for the day, week or month.
- Reinforce the familiar "STOP, LOOK and LISTEN."
- Pair your child with a responsible friend or relative.
- Emphasize the importance of balancing high-energy activity with sedentary activity: swimming followed by reading or listening to music, nature hikes followed by group discussions, boating followed by board games or group drama sessions.
- Avoid relying on prompts for every component of an activity. Allow your teen time to think it through.
- Use family meetings to assign room jobs, kitchen jobs and general household jobs to all. In this way your teen feels like a part of the team.
- Remember, it's summer! Taking some time out to lie on the grass and daydream is therapeutic (for both parents and teens).

Strategies specific to social/communication skills:

- For teens who tend to avoid eye contact and/or mumble with their head down, verbal reminders, such as "head up, look at my face while talking" or "look at me," will reinforce basic communication skills practiced during the school year.
- Attention-seeking behaviors such as speaking in a loud voice, interrupting and excessive talking may be handled by agreeing in advance on a parent's signal—perhaps an open hand raised to a cheek—whenever the behavior interferes with conversation. In this way, only the parent and teen know the secret signal, eliminating embarrassing verbal corrections or reprimands in front of others.
- Parents are often able to understand their teen's unintelligible speech and may reinforce poor speaking habits. Therapists suggest parents consistently ask the teen to look up, make eye contact and speak slowly.

Strategies specific to self-help/personal care skills:

- Shop for personal care items together. Let teens choose products themselves (within reason).
- Place a colorful plastic container or basket in the bathroom to hold all of your teen's personal grooming items. This helps in maintaining organization, especially if there is more than one teen in the household.
- Support exercises and activities that encourage proper alignment and posture and increase muscle tone, circulation and stimulation. Swimming, gymnastics, simplified yoga, tai chi, modified ballet and modern dance are all possibilities.
- Encourage proper nutrition with guided food shopping, cooking and baking sessions.
- Shop using grocery items pictured or written on 4"x6" cards. (Use coupons or newspaper pictures. The photos of the products shown will exactly match the products on the shelves, insuring successful item selection). Give the teen a collection of six cards or coupons and instructions to go through the aisles to find those items.
- Arrange partner shopping with a sibling, cousin or friend of your teenager. Make sure they are within close proximity to one another and that you are within calling distance.
- Have your teen plan simple meals, such as breakfast tacos or lunch sandwiches, using simple but detailed instructions on 4x6 cards, and set out (non-perishable) ingredients the night before. For complicated dishes, present directions in clear picture or word form, breaking each task down to its smallest component and have the teen complete each component sequentially.
- Remember to work within the normal activity schedule of the family. Incorporate life skills using prompts, and include peers for support. This method is relaxing and satisfying for parents, siblings and teens.

Strategies specific to community activities:

- The key to preparing for independence in community settings is including your teen in planning outings and using the experience as a learning tool. As you run family errands, talk over the purpose of each errand. Review the process needed to complete transactions at the bank, for example, or the post office or the dry cleaners. "What do you think will happen here?" "Why are we visiting the library this afternoon?"
- Review recognition of safety signs as you drive or walk with the family. Point out the STOP, RR (Rail Road), Push/Pull, Women's and Men's bathroom signs and ask your teen what to do at each sign.

...And the livin' is easy

Parents of adolescents may experience difficulty in maintaining age-appropriate independence and in balancing purposeful activity with rest and relaxation during the summer months. Practicing these strategies in everyday summer routines can easily and naturally promote and reinforce independent life skills. Backsliding will be minimized and teens with special needs may actually gain new skills for the coming year. By adapting these suggested techniques and strategies for use in summer's daily routine, parents encourage enthusiasm for independence and build their teen's self-reliance and reinforce self-esteem.

Carolyn O. Cantu , MS, OTR, is a licensed pediatric occupational therapist and educator with thirty-two years of experience who has practiced and taught all over the world. Most recently, she was a pediatric therapist and clinicial educator for the Infant Parent Program, Austin, TX.

Enjoyable Activities and Projects

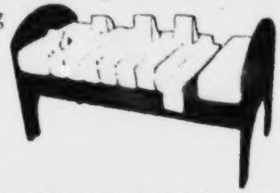
- Summer clubs
- Reading/tutorial programs
- Special Olympics
- Bake sales
- Summer bashes (tee shirts, entertainment, games, arts and crafts)
- Evening street parties
- Community based Routine Family Activities, (shopping, riding buses, banking, errands)
- Volunteer causes such as food banks, state parks, libraries, church landscaping

A way to keep spines straight that's so advanced, a child can do it in their sleep.

Sleep time is one of the most important parts of an adolescent's day. Especially for one with a curving spine. If a child with a curving spine doesn't have night-time support to help keep them straight during their growth spurt, the curving will become a CURVED spine. After that, the only option may be surgery.

With Dreama™, an innovative sleep system from Jenx, a child increases the odds of developing a straighter spine when they hit their growth spurt and into their adult life. By utilizing special foam blocks, Dreama™ adjusts to firmly support a body in any position—supine, prone, and side lying—extending the optimum positioning through 24 hours.

Finally, the straight story on sleeping with a curving spine. From A to Zzzz.



Dreama™. The dream of night-time positioning.

Teen & Young Adults

Getting Youth Up To PAR:

Using Participatory Action Research to Increase Self-Determination Skills

by Jessie Sandoval, Tanis Bryan, PhD, and Karen Burstein, PhD

It's not often you find a group of young adults who are willing to spend Saturday mornings working on a university research project. But this is not your typical research project, and these are not your typical young adults. With the involvement of Arizona State University faculty and a strategy called Participatory Action Research (PAR), a group of seven high school and college age students with physical disabilities are studying ways of overcoming the challenges of making the transition to adulthood.

What is PAR?

In PAR the scientific method is used to find solutions to everyday problems. People affected by the problem, not researchers, select the problems to study and collect the data. By using the scientific method participants systematically test strategies to overcome perceived barriers to attaining individual and group goals.

The process begins with participants identifying and defining a pressing problem. They then gather information to determine what is known and what is not known. They select a testing strategy, decide how to measure the effects of the strategy, implement it, record the results and evaluate the data utilizing graphing and statistical procedures. If the problem is solved, they go on to define a new problem. If the problem is not solved, they select another strategy for testing. Finally, participants may decide to take action by letting others know about the results of their research.

According to the National Council on Rehabilitation Education, PAR has become a strategy for effecting change in the field of rehabilitation services. It was used to develop the Reauthorization of the Rehabilitation Act, to document supported employment training job sites, to evaluate programs serving people with severe disabilities, to empower families of children with disabilities and to develop criteria for judging the quality of pediatric care.

Meet the Team

This study to examine perceived barriers to adulthood was conducted by seven high school and college students with physical and/or health and orthopedic impairments. During their sessions, the group learned about the PAR process, testing strategies, data collection, and the need for confidentiality. They learned how the scientific method is used in the social sciences and how the results of studies can impact our daily lives. The members selected a variety of personal goals and devised strategies to achieve them.

Jessie Sandoval is a 20-year-old college sophomore with cerebral palsy majoring in political science.

Casey Walker is a 21-year-old community college student with cerebral palsy.

Jay Dashefsky is a 21-year-old college junior with spina bifida.

Elisha Hilker is a 19-year-old high school student with spina bifida.

Linden Aitken is a 17-year-old high school junior with mitochondrial disease.

Chris Smith is a 19-year-old high school senior who has cerebral palsy.

Nick Luce is a 19- year-old high school student with cerebral palsy. He was a torch bearer in the last Olympics.

Tanis, the project director, was responsible for teaching the PAR process to the team and providing guidance on using it to solve problems. Dave, a young adult with quadriplegia, works for Arizona Bridge to Independent Living (ABIL).

The team completed two group projects. The first dealt with transportation. The team located Donna Powers, Executive Director of the Community Forum and an expert in transportation for people with disabilities in the Phoenix metropolitan area. She came to two meetings via public transportation with power point equipment and lunch packed onto her wheelchair. Following a presentation to the team members and their parents on the rights and responsibilities of persons with disabilities in using public transportation, she brought a bus and a driver to the site so that everyone had a chance to get on board and go for a ride. For some, it was their first time on a bus! Team members learned that there are many ways to access transportation in the Phoenix metropolitan area and how to qualify for these resources, while parents learned that their teenagers could safely use public transportation.

When the team received free tickets from the HoHoKam Baseball Stadium to attend a Chicago Cubs spring training game in Mesa, Arizona, the second team project was born. The group developed the 4-point Baseball Stadium Survey to evaluate the physical accessibility of the stadium. The Survey assesses the parking lot, concession stand, restrooms, ramps, seating and visibility. Each group member independently completed the Survey following the game. The team analyzed their data at the next group meeting. They found that HoHokam Stadium scored very high on parking lot, ramps, seating, and visibility. The stadium staff was helpful, both in the parking lot and in the seating area. After the game, team members were able to park their wheel chairs in a special spot so that they could interact with team members.

There were, however, a number of problems. The concession stand menu was a bit difficult to see and lids were not provided for sodas, making it difficult to carry them back to their seats. The team found it difficult to maneuver their wheelchairs in the restrooms and had problems reaching the bathroom sink. Because the stadium is planning some renovations, the team has drafted a letter

requesting management to take their experiences into account. That's the action part of participatory action research!

Some Expected—and Unexpected—Results

The group research projects were a natural outgrowth of shared discussions related to personal goals. It is apparent that it is not possible to attend college or work outside the home without transportation, nor is it easy to have social engagements with peers.

Further, it is difficult to participate in ordinary events that most Americans take for granted, like attending a baseball game, if you have to be concerned about getting to a seat or using a restroom. The complicated logistics of ordering, transporting and eating a hot dog and drinking a soda can prevent individuals with disabilities from participating in this ordinary American ritual. Of course friends and family members can assist in many ways, but it is apparent from the team's findings on the Baseball Survey that individuals with disabilities could be more independent and comfortable without engendering significant cost.

Aside from progress in meeting individual and group goals, the PAR process had an impact on the youth with disabilities that is less easily quantified. For one, these youth grew up under the public policy of full inclusion, the Individuals with Disabilities Education Act (IDEA) and the Americans with Disabilities Act (ADA). They lived at home, attended community schools, and most attended general education classrooms. They share the same goals and aspirations as youth who do not have physical disabilities.

Nonetheless, they have had little opportunity to interact with others with disabilities. Everyone benefits from the experience of being able to talk to others like themselves. Group members were much affected by hearing others relate experiences similar to their own. Being able to share these experiences with one another was therapeutic and brought the group closer together.

PAR's emphasis on the scientific process as a means of problem solving is empowering. It helps participants focus on solutions rather than personal frailties. In addition, being responsible for reporting progress toward one's goal to the group is very motivating. More can be learned from this experience than an understanding of the scientific process. Those participating come to care about each other and offer their newfound friends advice, support, empathy and respect. **EP**

BASEBALL STADIUM SURVEY

Please rate the following items.
Name of Stadium ______________________________

A. STADIUM ENTRY AND PARKING LOT

1. The number of handicapped parking spaces was:

Very Inadequate	Somewhat Inadequate	Adequate	Very Adequate	Not Applicable
1	2	3	4	

5. Provisions for entering through the gate were:

Very Inadequate	Somewhat Inadequate	Adequate	Very Adequate	Not Applicable
1	2	3	4	

6. The distance from parking to the stadium was:

Too Far	Not So Far	Pretty Close	Very Close	Not Applicable
1	2	3	4	

B. GETTING AROUND THE STADIUM

7. Maneuvering the ramps were:

Very Difficult	Difficult	Easy	Very Easy	Not Applicable
1	2	3	4	

9. Seating was _______ to find:

Very Difficult	Difficult	Easy	Very Easy	Not Applicable
1	2	3	4	

10. Space around the wheelchair was:

Very Inadequate	Somewhat Adequate	Adequate	Very Adequate	Not Applicable
1	2	3	4	

C. CONCESSION STAND

13. Access to the concession stand from the seat was:

Very Poor	Poor	Good	Very Good	Not Applicable
1	2	3	4	

18. Access to condiments, straws, and napkins was:

Very Poor	Poor	Good	Very Good	Not Applicable
1	2	3	4	

19. Transporting food back to the seat was:

Very Difficult	Difficult	Easy	Very Easy	Not Applicable
1	2	3	4	

D. BATHROOM FACILITIES

24. The access to the facility was:

Very Poor	Poor	Good	Very Good	Not Applicable
1	2	3	4	

25. The room to park a wheelchair was:

Very Inadequate	Somewhat Adequate	Adequate	Very Adequate	Not Applicable
1	2	3	4	

26. The sinks were arranged in such a manner that they were __________ to use:

Very Difficult	Difficult	Easy	Very Easy	Not Applicable
1	2	3	4	

E. PUBLIC TRANSPORTATION

31. Public transportation to the ballpark was:

Very Inadequate	Somewhat Adequate	Adequate	Very Adequate	Not Applicable
1 2		3	4	

32. Do you know if public transportation to the stadium is available?

☐ 1) is available ☐ 2) is NOT available ☐ 3) Don't know

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

Universal Newborn Screening

In 1961, Dr. Robert Guthrie of the University of Buffalo developed a laboratory test to detect phenylketonuria (PKU) in newborns. PKU is an inherited metabolic disorder resulting from an enzyme deficiency; if left untreated, it results in profound mental retardation. In 1963 Massachusetts became the first state to mandate screening for PKU, which can be treated by lifelong dietary management and counseling. The National Association for Retarded Children (now The ARC), the Children's Bureau and the Kennedy Foundation were foremost among the organizations that pushed for widespread adoption of the Guthrie test, and by 1966 it was required for all children by all 50 states and the District of Columbia.

Dr. Guthrie and other researchers continued to develop newborn screening (NBS) tests to detect many more disorders, and each state decided what screens would be available for its newborns. Significant disparities resulted; in 1997, in Massachusetts, infants were tested for 10 or more disorders, while Utah's babies were screened for three. Montana and South Dakota each mandated three tests and offered one other by special request only. In the same period, with the introduction of ever-smaller and more powerful microprocessors, technology and equipment became significantly more sophisticated. This permitted testing that had not been feasible before. A process called tandem mass spectrometry (tandem MS, MS/MS) can now run tests for nearly 40 disorders at one time. None are curable, but all are treatable.

In the last two years, many states have expanded their NBS programs. Almost all Pennsylvania hospitals now offer the full spectrum of testing, although the law mandates testing for only six. Massachusetts routinely screens for more than 15 disorders and is running a pilot program offering 30+ tests. Wisconsin has almost tripled availability, from 7 tests to 20. Yet universal NBS still engenders much controversy, and there are many issues to be resolved before consensus can be reached on how the US will move forward.

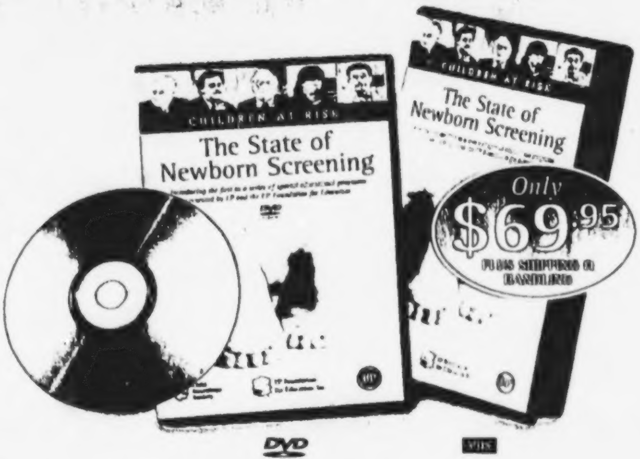
The data tells us that of the four million babies born in the US each year, ten to twelve thousand may have one or more of these detectable...and treatable...disorders

ISSUES: These may be economic, political, professional, sociocultural, religious. Capital spending, training, payment policies, long-term follow-up; insufficient hard financial data; union issues; professional knowledge levels and practice habits; citizen knowledge, and cultural and religious beliefs and practices; insurance, managed care companies, Medicaid, ChIP programs, the uninsured—all these and many more must be part of discussions and resolution.

With the current system, a child born in Louisiana with galactosemia will likely live a life marked by mental retardation and other special health care needs, while similarly affected children born the same day in most of the rest of the country will receive immediate treatment and become productive members of society. The data tell us that of the four million babies born in the US each year, ten to twelve thousand will have one or more of these detectable disorders, an almost-negligible number. The overall cost or benefit to our society, though, will vary wildly from one child to another because of the patchwork of screening availability. We as a nation must find a way to embrace universal NBS and make it routine for all children born in the US. More than that, it is downright wrong not to do so when it has proven its worth time and again!

It is a question of education and awareness. Research shows that the average couple planning to have children does not know anything about existing screening programs, much less the capabilities offered by tandem MS, largely because OB/GYNs, pediatricians, genetic counselors and related professionals are not familiar with universal NBS. The education gap relates to professionals and consumers, rich and poor, people of every race, religion and ethnicity. Few people know much about any of the issues. Worse, among the people who do profess knowledge of NBS and the issues, a good deal of what they "know" is wrong.

The information you need on Newborn Screening is finally available on DVD and video



Children at Risk:

The State of Newborn Screening

is now available on DVD and VHS. Introducing the first in a series of special educational programs presented by EP and the EP Foundation for Education, Inc., a 501(C)3 Not For Profit Corporation.

EP Foundation for Education, Inc. **Child Neurology Society**

Newborn screening can detect up to 39 metabolic disorders from one blood spot. All are treatable when diagnosed at birth, offering the chance for a full and productive life.

Leading medical and scientific professionals are gathered to provide the most current information available. You can view this valuable resource at your convenience and the DVD is indexed so that key topics are easily accessible.

Miracle League Playing Fields

By Maria Tortoreto

Jeremy Ellington, sporting his jersey for the Braves, shows off his swing.

Jeremy Ellington lives for sports. The competitive 16-year-old, donning the jersey for his baseball team, the Braves, hits homeruns and steals bases with confidence. With the crowd cheering him on, Jeremy rounds the bases in his wheelchair every time with a joyful look in his eyes. Playing baseball is a recreational pastime for most Americans, but for Jeremy and the other children in the Miracle League, it is a dream come true.

The Miracle League is an increasingly popular baseball league for children with all ranges of disabilities. Gary Garner, its co-creator, began the league for his daughter Lindsay, now 12, who has muscular dystrophy. Based in Conyers, Georgia, there are over 200 children playing on a dozen teams.

With the help of the local Rotary Club, the parents of players and the Ronald McDonald Foundation, over $750,000 was raised to help build the "McMiracle Field", the first field built especially for the Miracle League which opened in April 2000. Complete with a flat pitching mound and bases, synthetic turf and extra-wide dugouts, this field is ideal for people with disabilities.

Make Dreams come True

Ronardo Scarebrook and his father, Mario, watch the game, anxiously awaiting their turn.

continued from page 43

his own special way, throwing the ball with his feet, because no one is excluded from the Miracle League.

Very few rules exist in this unique league. In every inning everyone bats, everyone scores, and everyone wins. There are only two innings each game, and the last person to bat gets to go around the bases for a homerun. The only competition is players trying to hit the ball harder than last time, or get to first base quicker. Since many of the players have physical limitations making it difficult to play, they have a buddy who helps them hit, throw, and round the bases. Often the buddy will be a family member, but children from the local Little League help out as well.

Since its beginning less than two years ago, the Miracle League has been featured on major broadcast and cable networks as well as appearing in national magazines. With such exposure, interest has stirred all over the country for expansion of the Miracle League. A second field has been constructed in South Carolina, and 34 others across the country are under way. This fall, one will open in Orlando, Florida and will be featured at the World Congress on Disabilities being held there this October. By the end of 2003, the league hopes to have about 100 fields across the nation.

"We didn't realize the need was as great as it is," said Garner, who owns a small electrical contracting company outside of Atlanta and invests his free time in serving as director of the Miracle League. "What we realized was that (most) handicapped kids did not have anything available to them as far as ongoing athletic activities."

"Our kids are the ones who don't get invited to the birthday parties, and they're not the ones who other kids invite to come over to their house after church on Sundays," adds Garner. "That makes this activity that much more important to them."

Jeremy's mother, Debra Carter, sees more positives for the players than simply self-confidence. It's a networking system; the children make friends while the parents talk about new research and doctors for their children, all the while doing something great for the community.

As Jeremy said to Debra after a recent game, "It's awesome, mom!" EP

New York School Renamed for Mickey Mantle

June of 2002 marked the beginning of a new identity for PS 811, an Upper West Side school for disabled children located at 466 West End Ave in NY. The school was renamed the "Mickey Mantle School" during a ceremoney that included the revealing of a bronze plaque of the baseball hero.

Principal Philip Santise explained that both the students and faculty "are proud to be a part of his (Mantle's) legacy." Santise, a Yankee fan native to the Bronx, was active in getting the school named after "the Mick."

Hyperbaric Oxygen Therapy [HBOT] is the breathing of 100% oxygen under increased atmospheric pressure. The effects of HBOT on the organs and tissues of the body are multi faceted.*

South Florida Center for H.O.P.E offers a clean and bright friendly atmosphere, using only state-of-the-art equipment. Our doctors and technicians are trained by a UHMS accredited course and certified in HBOT by the NBDHMT. They come with many years experience in the field of hyperbaric medicine.

* Hyperbaric Medicine Practice

EP NEEDS YOUR HELP!

This fall we are creating some exciting new features and expanding others, but we need your input!

More specifically, we want you to aid in identifying products, services and institutions that are working to make a real difference in the lives of children with disabilities.

To start, we want you to tell us about any effective toy, educational software program, play product or learning tool you or a child with a disability has used. There are no boundaries to these nominations save that they must have been purchased within the last year and are being used by a child with a disability.

We ask that you provide only the following information:

- Your name
- Product name
- When bought (month/year)
- Child using it and his/her disability
- Why the product is effective in helping the child
- Do you have photos (yes or no - Please do not send)
- Any additional comment you may want to make.

Secondly, have you had a particularly good vacation or experience with a hotel, resort or bed & breakfast that made it a point to help children with a disability? If so please let us know as soon as possible so we can include it in an upcoming story about the 15 best hospitality sites in the United States.

Here's the list of information we need:

- Your name
- Name of hotel, resort or bed & breakfast
- Contact or manager (if known)
- Location
- Brief description of your experience
- Do you have photos (yes or no - Please do not send)
- Any additional comments you would like to provide

Finally, for our September issue, we are looking for a wonderful teacher in each of the 50 states. These selfless individuals, regular or special education, will be honored in the issue. But the nomination must come from you, the parents of children with disabilities. If you know of such a person, please include the following information in your nomination:

- Your name
- Name of the teacher
- Contact information
- Location
- Brief description of your experience
- Do you have photos (yes or no - Please do not send)
- Any comments you may want to make.

This is a formidable task we are setting, but it can be done with your help!

Replies to any or all of these requests must be made by August 10, 2002, by emailing us directly at epedit@aol.com or by writing to:

Campers covered in body paint pose for a picture along the beach of Lake Powell, Arizona.

Adventure in Self Discovery

Surrounded by the breathtaking canyon vistas of Lake Powell, Arizona, teens and young adults of all abilities enjoy adapted recreation and building self-confidence at Easter Seals of Arizona's Adventure Camp.

by Bridget M. Lyne

Each summer for the past three years, the unique week-long camp hosts 20 participants, ages 13-23 and provides an adventure for mind and body.

"We give campers the opportunity to experiment with relying on themselves," says Mike Tufte, Easter Seals of Arizona's director of adapted recreation and education who is among the 15 staffers who facilitate the camp. "They find out that the only thing holding them back is themselves, or their parents or families not wanting to let them take that step and experience something on their own."

NEW IMPROVED
QUICK-MIX FORMULA
DISSOLVES INSTANTLY. NO LUMPING.

DIAFOODS THICK-IT brings the joy of eating back to people with swallowing problems.

Here's the solution for the millions of young and old who need modified consistencies to enjoy eating.

DIAFOODS THICK-IT, when mixed with hot or cold, thick or thin liquids and pureed foods, produces any desired consistency quickly, easily and controllably. But it does not change the taste or appearance of the food it thickens.

DIAFOODS THICK-IT adds sixteen calories per tablespoon for nourishment but is very low in sodium for people on sodium-restricted diets. And it helps hydrate patients because it will not bind water or fluids.

DIAFOODS THICK-IT is the market-maker and the #1 selling brand of Instant Food Thickener. It is recommended by speech and language pathologists, dietitians and nutritionists in hospitals, nursing homes and rehabilitation facilities across the country.

For product literature and advice, a free sample and information where **DIAFOODS THICK-IT** may be purchased, **call… (800) 333-0003**.

Free educational material, call… (800) 333-0003.

The booklet **"Dysphagia, A Review For Health Professionals"** discusses causes, evaluation and treatment of dysphagia.

The pamphlet **"Swallowing Problems"** helps patients and caregivers understand and adapt to dysphagia.

Above: Campers carefully decorate each other with colorful body paint.

Right: Jetskiing and Kayaking are just a few of the many exciting aquatic activities shared by the campers.

continued from 48

Since the only way to reach the remote camp site is by boat, Easter Seals rents a houseboat that has been made wheelchair-accessible to navigate the trip to one of the lake's secluded coves with a sandy beach. The boat serves as the camp's main gathering place, kitchen and dining hall as well as providing sleeping quarters for some campers with special needs such as ventilators. Others pitch tents on the shore.

Each day has a theme that is celebrated in craft projects and meals. Campers take turns helping in the kitchen at least one meal.

Other activities at camp include a variety of sports and aquatic recreation, from swimming and riding wave runners to hiking and fishing. "We bring all the tools that we can think of and adapt each event for whatever the needs are so that everyone can enjoy it," says Mike. Some modifications include outfitting kayaks with seats and back rests for kids who need support, and portable plastic flooring for

Camp Cuisine

SOPAPILLAS

Ingredients

1 cup flower
1/4 cup buttermilk
1/4 cup water
1 tsp vegetable oil
1 tsp baking powder
1/2 tsp salt

Combine flour, milk, oil, powder and salt in bowl. Mix well. Turn dough out onto a floured surface and roll 1/8 inch thick. Fold dough in half and roll again to same thickness. Cut into three-inch triangles.

Heat 4 cups oil in a large, deep skillet (about 375 degrees). Add triangles, a few at a time, and fry on both sides until golden brown. Remove and drain on paper towels. Sprinkle with powdered sugar and serve. Drizzle honey if desired.

sidewalks—giving campers with mobility challenges easy access around the site. "It's ideal for putting along the beach front to get campers right up to the edge of the water," Mike explains.

Campers also participate in team-building games which demonstrate that they each have a contribution to make. Mike notes that the sense of accomplishment from the entire Camp experience is invaluable. "They find out that everyone has a disability of some kind, and that everyone also has strengths. Here they are in a remote area, where they have to work a bit, doing something exceptional. For a young person with some significant disabilities in his or her life, this is a real confidence boost, you can see it in their eyes and the smile from ear to ear."

To help parents cover the cost of sending their teen to camp, Easter Seals of Arizona provides income-based scholarships and has worked to get the camp covered under state-funded respite. EP

For more information about Easter Seals of Arizona, check out their Web site: http://www.azseals.org

With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler.***

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Please visit our Worldwide Web site at www.redbarn-enter.com for additional details and a video demonstration of the ***Creepster Crawler.***

HYPERBARIC OXYGEN THERAPY

Hyperbaric Oxygen Therapy (HBOT, HBO, HBO2) uses a special chamber to allow a person to breathe 100 percent pure oxygen while the pressure in the chamber is higher than one atmosphere. HBOT first received approval from the FDA as a treatment for divers' decompression sickness (the bends). Additional indications for HBOT use can be divided into two categories circulatory conditions and wound repair.

CIRCULATORY & WOUND HEALING

Providing pure oxygen at higher-than-normal pressure counteracts the effects of these conditions. In carbon monoxide poisoning, decompression sickness and smoke inhalation, the added oxygen returns the mix of blood gases to normal; whereas in an air or gas embolism the higher pressure bursts the bubble obstructing a blood vessel and normal blood flow is restored.

In wound healing, higher pressure speeds up the oxygenation process, killing bacteria and allowing the wound to heal. Hence, an injury will heal faster at sea level than an identical one at 8000 feet.

TREATING CEREBRAL PALSY (CP)

CP is thought to result from an injury or insult to the brain, prenatally or perinatally, that creates lesions. It is a collection of disorders, not a disease, and the degree of each disorder can vary. Someone with CP is likely to have hypertonia—spasticity—of one or more groups of muscles. The likelihood is high that individuals with CP will have some degree of developmental delay and possibly a seizure disorder such as epilepsy.

There is no cure for CP at this time, only amelioration of symptoms. Among the therapeutic modalities used have been physical, occupational and/or speech therapy, patterning, selective dorsal rhizotomies, intrathecal baclofen pumps, and injections of botulinum toxin A.

Although it is a so-called "off-label" use, CP has been treated with HBOT since the mid-1980s. Anecdotal evidence suggests that HBOT usage results in reduced spasticity, improvement in balance and hypotonia, acceleration of language and cognition, and increased awareness and attention. Thousands of children around the world have received HBOT based on such reports. However, the results of only a few small clinical trials have been published. The most widely known is the "Canadian study;" whose finding are considered interesting but not conclusive.due to flaws in the design of the study.

NEW INFORMATION

Between January 1999 and March 2000, the Division of Child Development at Weill Medical College of Cornell University (Evelyn Lipper, MD, Director; Maureen Packard, MD, principal investigator) studied the effects of 40 one-hour HBOT sessions at 1.5 atmospheres on the motor, cognitive and language skills of 23 young children with moderate to severe CP. The findings are being prepared for publication.

The researchers used standard assessment tools to monitor changes in study participants. Additionally, parents were asked to keep diaries of their child's progress, noting changes in sleep, feeding, toileting, illnesses, mood/energy, movement, play, attention/alertness and language (words or sounds).

RESULTS AND CONCLUSION

The researchers discuss at some length the results over time, including patterns of changes, side effects, and the overall impact of HBOT on children depending on age, symptoms and degree of involvement. They note that some 30 percent of families reported regression after HBOT therapy ended. The researchers conclude that "For some children with moderate to sever CP, there is evidence that HBOT improves motor skills, attention, language and play…The changes observed do not constitute a cure of CP, but do constitute functionally substantial improvement." EP

Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002
LOCATION:
Orange County Convention Center—Orlando, Florida

A UNIQUE GATHERING—A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract **physicians • families • direct support professionals • people with disabilities • allied health care professionals • educators • adapted physical education specialists.**

TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

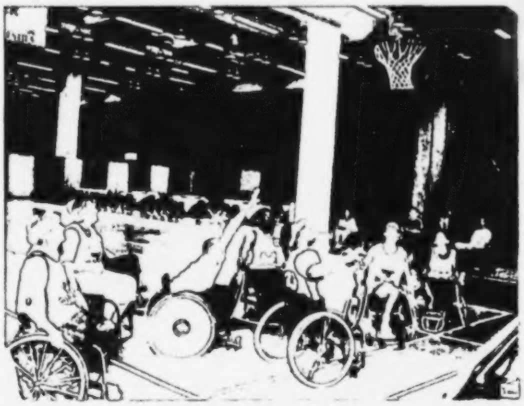
SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more, hosted by America's Athletes with Disabilities.

EMPLOYMENT SYMPOSIUM PAVILION: Human resource managers will discuss career opportunities, sponsored by the Florida Department of Education, Division of Vocational Rehabilitation Services (VRS) and McDonald's Corporation.

ASSISTIVE TECHNOLOGY LEARNING CENTER: Produced by FAAST. Computer Stations designed for hands-on education and fun.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.



CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation will be provided through approved accreditation institutions.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with the VRS will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

WORLD CONGRESS & EXPOSITION ON DISABILITIES
WCD

WORLD CONGRESS & EXPOSITION ON DISABILITIES ANNOUNCES STELLAR KEYNOTE LINE-UP

The World Congress & Exposition on Disabilities (WCD) announces its Keynote Speakers for the Third Annual event, taking place October 3-5, 2002 in its new location the Orange County Convention Center in Orlando, Florida. Four industry leaders from the educational, medical, business and military sectors are scheduled to speak. Governor Jeb Bush is an intended special guest speaker on Friday, October 4th at 5:30 p.m. The WCD (www.wcdexpo.com) is a comprehensive forum that educates, informs and provides a useful exchange of ideas between persons with disabilities and special needs, their families, health-care professionals and educators

"We're thrilled about the 2002 Keynote Address Program. Our attendees will have the rare opportunity to be exposed to and educated by true visionaries in their respected fields. We anticipate an excellent response to this year's speakers," said Steve Gross, Vice President of WCD.

Robert H. Pasternack, of the U.S. Department of Education, will kick off the WCD Keynote program on Thursday, October 3rd at 10:00 a.m. Mr. Pasternack is the Assistant Secretary for Special Education and Rehabilitative Services and serves as principal advisor to the U.S. Secretary of Education on these matters. He also has a lifelong personal experience with people with disabilities, as the legal guardian for nearly 20 years for his brother, who was born with Down syndrome.

On Thursday, October 3rd at 5:15 p.m., Jeff Taylor, Founder and Chairman of Monster and Global Director, Interactive of TMP will present his speech. Mr. Taylor is recognized as an innovator and a visionary in both the Internet and career industries. Through Mr. Taylor's guidance and leadership, Monster catapulted to the number one position in the online career industry, currently serving over 10 million job seekers each month, and has reinvented the way in which the world looks for employment.

Francis S. Collins, M.D., Ph.D., a Physician-Geneticist for the National Human Genome Research Institute (NHGRI), part of the National Institutes of Health, will deliver a Keynote on Friday, October 4th at 10:00 a.m. Dr. Collins oversees a complex multi-disciplinary project aimed at mapping and sequencing the entire human DNA, and determining aspects of its function. This is considered one of the most important scientific projects of our time.

The final Keynote address will be presented by General James L. Jones, 32nd Commandant of the Marine Corps and his wife, Mrs. Diane Jones on Saturday, October 5th at 9:00 a.m. General Jones illustrious career has spanned over 35 years of serving his country including active duty in Vietnam, Japan, Northern Iraq, Turkey, Germany, Bosnia, and Macedonia. He was promoted to General on June 30, 1991 and assumed his current post on July 1, 1999. The General and Mrs. Jones are active members of the U.S. Armed Forces Exceptional Family Member Program. This program provides assistance to family members of service personnel who have special needs.

Mrs. Jones has been a lifelong advocate for individuals with disabilities, beginning thirty-one years ago with the birth of a daughter with Fragile-X-Syndrome. Combining this role with being a strong supporter of military families, she has made significant contributions to both the Marine Corps family and to people with disabilities.

With a Master's Degree in Special

Education, Mrs. Jones' career path has included being a teacher and administrator in special education, and a Governor's appointee to the California State Council on Developmental Disabilities. As First Lady of the Marine Corps, she has been instrumental in improving the quality of life for those Marines with family members in the Exceptional Family Member Program by fostering a Committee for Persons with Disabilities on every major Marine base, as well as services and partnerships that have resulted in improved accessibility, childcare, respite care and recreational options.

In addition to the Keynote Addresses, the WCD will present an intensive three-day multi-disciplinary conference program that includes more than 200 educational sessions. The exhibit floor will feature more than 250 companies showcasing the latest products and services including pharmaceutical, assistive technology, automotive, mobility, durable medical equipment, personal care, insurance, computer, nutrition and many other industries. For more information on the WCD, visit www.wcdexpo.com or call 1-877-WCD-EXPO.

Appeals Court Allows Patients to Sue States

In an important victory for children with disabilities and other Medicaid patients, two federal appeals courts have ruled that people may sue state officials not providing benefits promised under the federal Medicaid law.

Previously, states have reduced or eliminated services mandated by Congress while claiming exemption from legal action under the doctrine of sovereign immunity. However, in decisions made this past May, the Court of Appeals for the Fourth Circuit in Richmond, VA, and the Sixth Circuit in Cincinnati, OH, rejected these arguments. This opened doors for some of the nation's 40 million Medicaid recipients who may now sue in order to enforce provisions of federal laws not implemented by individual states. The two appeals cover the states of Virginia, North Carolina, South Carolina, Michigan, Ohio, Maryland, West Virginia, Kentucky and Tennessee.

State officials claimed support from recent Supreme Court decisions that sided with states fighting against congressional mandates. However, as the Richmond court ruled, "a state officer acting in violation of federal law loses the cloak of state immunity." Writing for the Richmond court, Judge Paul V. Niemeyer said that since (North Carolina) elected to participate in the federal Medicaid program, (it is therefore bound) by the requirements of the (federal) Medicaid Act. Exception for any state, Niemeyer stated, lay only "if the state declined federal funds and operated a state program for medical assistance using its own standard, or to decline to operate such a program at all."

Other federal circuit courts are expected to hand down similar decisions as cases begin to reach them. However, what these rulings will mean in the short term is unclear. State officials in both instances indicated they would evaluate whether an appeal to the Supreme Court would overturn these rulings. In the recent past, the Supreme Court has sided with the states on many issues.

New Publication on Parentally Placed Students

The Urban Special Education Leadership Collaborative and the IDEA Local Implementation by Local Administrators (ILIAD) Partnership announce a new publication intended to provide an overview of IDEA and relevant case law pertaining to parentally-placed students with disabilities in private schools. This may be obtained free of charge by visiting their website http://www.ideapractices.org/resources/detail.php?id=22082 and by contacting ILIAD at (877) 232-4332 or (866) 915-5000 (Toll free TTY).

Jewelry Promotes Equality

Audrey Lewis, founder of Created Equal, Inc. and a mother of a child with Spinal Muscular Atrophy has designed a new way of honoring friends and family living with a diisability. Her line of family pins features children, men and women (in wheelchairs or standing) and angels formed from sterling silver. A portion of each sale will be donated to the Greensboro Justice Fund and Families of Spinal Muscular Atrophy (S.M.A.) For more information on Created Equal, Inc and their jewelry call (800) 304-8129, write to P.O. Box 6212, Libertyville, IL 60048, email CreateEqual@aol.com, or visit their website: http://www.created-equal.com.

NDSS Launches Web site for Teens

Launched in May, Club NDSS is the first interactive online community for teens and adults with Down syndrome and other developmental disabilities. The site provides message boards, photos and stories about people with Down syndrome as well as Internet and computer training. Upcoming features include a "my web page" feature and moderated chats. Access the site by visiting http://www.ClubNDSS.org.

CALENDAR OF EVENTS

8/23-25 National Down syndrome Congress 2002 Annual Conference

Join the NDSC in Denver, CO for an array of presenters including professionals, self-advocates and parents with professional expertise. Separate conferences for teenagers and adults with Down syndrome and for siblings ages 12 through high school will also be held. For more information contact the NDSC by phone (800.232.6372), E-mail (info@ndsccenter.org) or by visiting http://www.ndsccenter.org.

9/11-14 American Academy for Cerebral Palsy and Developmental Medicine 56th Annual Meeting

For more information on the 2002 New Orleans meeting contact the AACPDM by phone (847.698.1635), fax (847.823.0536), E-mail (woppenhe@ucla.edu) or by visiting http://www.aacpdm.org.

10/26 Center for Development of Human Services 6th Annual Great Beginnings Conference

Held in Marlborough Massachusetts, this year's focus is Child-Directed Learning. Presentations and workshops cover language experiences, prevention of reading difficulties, challenging behavior, family-centered OT/PT, Autism and culturally responsive practice.
To obtain more information contact Debi Lang at (508)473-3422 x305, dlang@cdhsgroup.org or visit http://www.hsmc.org.

For Further Reading...

by Megan Henninger

Looking for further information on transition planning? The following titles represent a cross section of books available on this topic. To access these and other titles contact the EP Library online (http://www.eplibrary.com), by fax (201-947-9376) or by calling (800) 535-1910.

THE ROAD Ahead

The Road Ahead: Transition to Adult Life for Persons with Disabilities
EDITED BY KEITH STOREY, PAUL BATES & DAWN HUNTER
Training Resource Network, Inc.
Item Code: PE6963LD Price: $38.95

Storey, Bates and Hunter create a general resource for all disabilities with this book. Each chapter, contributed by various experts in the field of special education, begins with a list of questions that will be answered. To illustrate the ideas being expressed diagrams and tables are included as well as a "Window to the World" case study that applies the strategies outlined in the chapter. Chapter topics include person-centered transition planning, career development, employment, social life skills and interaction, supported living and post-secondary education. Connecting these chapters is the fundamental philosophy that planning for a person with disabilities should include the person in the decision making process. Appropriate for parents, teachers, social workers, employers, IEP team members and other professionals involved with development of a person with disabilities, the book contains references at the end of each chapter and an appendix of helpful organizations.

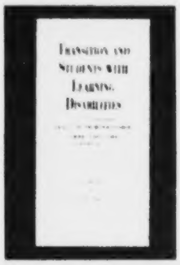
Transitional Skills for Post Secondary Success
Reflections for Students with Learning Disabilities

Transition Skills for Post Secondary Success: Reflections for Students with Learning Disabilities
EDITED BY TERESA ALLISSA CITRO
Learning Disabilities Association of Massachusetts
Item Code: LD7110LD Price: $24.99

Editor Citro has compiled a practical guide to the transition process that provides advocacy tips for parents and professionals coupled with study tips for teens. The first chapter explains learning disabilities while subsequent chapters furnish information on such topics as standardized tests, choosing a major, financial planning, college hunting, visiting and interviewing at prospective schools as well as explaining resources available in college. Information on testing accommodations, technological aids, an advocacy checklist for parents, a self-awareness checklist for teens, information from the US Department of Education as well as chapter references are included in the back of the book.



Transition and Students with Learning Disabilities: Facilitating the Movement from School to Adult Life
EDITED BY JAMES R. PATTON & GINGER BLALOCK • Pro-Ed Inc.
Item Code: TRN2463GN
Price: $32.95

Designed to give the professional educator a comprehensive overview of transition planning, the book addresses student participation, family involvement, early planning, the importance of cultural factors and a comprehensive overview of transition planning. Chapters discuss the current state of transition planning, barriers to success that exist and possible reform of transition planning legislation, self-determination and life skills, vocational education and rehabilitation, higher education, community transition teams and transition plan assessment. The appendix includes the position statement of the Division on Career Development and Transition of the Council for Exceptional Children. References for further reading can be found at the end of the book.

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

HYPERBARIC OXYGENATION FOR THE COMATOSE CHILD

There is some hope for the comatose child suffering from severe brain injuries, cerebral palsy, or anoxic encephalopathy. Children with Glasgow Coma scales from 3-5 present tremendous financial and emotional burdens, since these little ones may live for many years. When considering care of tracheotomy, gastric tube for feeding, physical therapy, occupational therapy, speech therapy, nursing care, recurrent hospitalizations, medications, vans, and modifications to the home, expenditures may represent multi-million dollars.

Intensive hyperbaric oxygenation is no miracle, but it provides some hope. In certain instances the child is able to communicate verbally, by computer or word board. Eighty percent have the G-tube removed and seventy percent have the tracheotomies closed. Frequently, bowels become normal and nutrition is re-established. Routine monthly medications are reduced and hospitalizations are markedly decreased. Although few children will return fully to society, substantial improvements will give them a better quality of life in addition to a ninety percent reduction in overall costs.

For more information on hyperbaric oxygenation therapy and life planning, call the Ocean Hyperbaric Neurologic Center at (800) 552-0255.

Hyperbaric Oxygenation for Cerebral Palsy and the Brain-Injured Child..

by R. A. Neubauer, M.D.

Dr. Neubauer's new book is a complete guide written for the professional as well as the caregiver of exceptional children. The book describes the latest information on hyperbaric oxygenation therapy including improved brain function as visualized through functional imaging. Clinical and scientific data along with references are included.

Conquering the Jargon Jungle

Technology terms a parent needs to know

by Sheryl Burgstahler, PhD

It doesn't take much "tech talk" to feel bombarded with technical jargon—intranet, middleware, hypertext, multi-media… Sometimes it is hard to sort out important terms from technical trivia.

I suggest advocating for technology that is accessible for all of the students in our schools. A few tech terms that are important for parents of young people with disabilities to understand in order to advocate for a more accessible world are assistive technology, adaptive technology, electronic and information technology.

Assistive technology (AT) refers to products that people with disabilities use to gain access to environments and activities where their participation would otherwise be limited. AT can maximize physical or mental functioning and minimize the impact of a disability. Assistive technology can help people perform daily living tasks, communicate with others and gain access to education, employment, community activities and recreation. Examples of AT include communication aids, hearing aids, prostheses, wheelchairs, walkers, van lifts and computer access devices.

Sometimes the term "adaptive technology" is used to mean the same thing as assistive technology; in other cases, it refers to a more narrow range of products that provide computer-access, such as speech input devices and alternative keyboards.

Electronic and information technology includes a broad range of products used to acquire, store, manipulate, and transmit information. These technologies include computers, software, Web sites, telephones, science lab equipment, CDs, videotapes, photocopiers, fax machines and calculators.

Universal design is defined by the Center for Universal Design at North Carolina State University as "the design of products and environments to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design."

To support this idea, the Center established a set of principles to provide guidance in the design of environments, communications and products. These principles embrace the idea that the design accommodates a wide range of individual preferences and abilities; communicates necessary information effectively, regardless of environmental conditions or the sensory abilities of the users; can be used efficiently and comfortably, and with a minimum of fatigue; is an appropriate size; and can be used by people with a wide variety of body sizes, postures or mobility skills.

The concept of universal design can be applied to all instructional activities as well as facility and technology design. For example, the manager of a computer lab is applying universal design when she makes adjustable desks and tables available in anticipation of students for whom the standard table height is not appropriate, perhaps because they are very small or large in stature or use a wheelchair. A teacher is applying universal design when he provides content in a variety of ways to address the needs of auditory learners, tactile learners, individuals who are blind or cannot move their hands and learners with other types of learning styles, abilities and disabilities in his classroom.

Universal design principles applied to electronic and information technology creates products that are more usable by everyone. By considering the needs of people with disabilities in the process they create "accessible" electronic and information technology. These products minimize the need for AT and are compatible with existing AT products.

The following examples demonstrate the benefits of accessible electronic and information technology:

- An accessible videotape has captioning available for individuals who are deaf and audio description available for those who are blind.
- Accessible instructional software

Dr. Sheryl Burgstahler is the director of the DO-IT (Disabilities, Opportunities, Internetworking, and Technology) program. DO-IT is funded by the US Dept. of Education, the State of Washington and many other organizations. DO-IT serves to empower young people with disabilities as they transition to college and careers through the use of computers, assistive technology and the Internet. "Tech Talk" is designed to address practical ways of integrating technology into educational, work and home environments. Dr. Burgstahler will also answer readers questions through this column. Please send correspondence to: Dr. Burgstahler, University of Washington, Box 354842 Seattle, WA 98195; fax: (206) 221-4171; e-mail:sherylb@u.washington.edu.

allows students with disabilities to participate side-by-side with their classmates as they complete assignments and engage in simulations and tutorials. It is compatible with speech output systems used by students who are blind and alternative keyboards used by those who cannot use their hands; and includes visual content alternatives for auditory output so that students who are deaf can participate fully.

- The features of an accessible telephone are usable by people who have mobility, visual and hearing impairments, perhaps in concert with AT.
- Accessible Web pages allow students who are blind to access all of the content at the site using their speech output systems.

Just as ramps installed for wheelchair users also benefit those who are pushing delivery carts or baby strollers, accessible electronic and information technology benefits a wide range of individuals as well. For example, captioning on videotapes can benefit individuals whose first language is not English and individuals who are learning to read.

Access to electronic and information technology has the potential to promote academic and career success for students with disabilities. However, the electronic and information technology that they need to access must be compatible with the AT they use. Also, the facilities, information resources and instruction must be accessible to them in order to gain the full benefits of technology. For example, consider the case where a student who is blind is provided with speech output technology as part of the IEP (Individualized Education Plan) process. This system allows the student to access all of the

text presented on the computer screen. So far so good. Next, imagine that this student goes to the computer lab to do an Internet-based assignment. She uses her speech output system with the Web site. However, her system cannot read the graphics and they are not presented with text alternatives. Providing text alternatives to describe graphic images is not a difficult thing to do; but unless the Web developer is thinking in terms of universal design it is unlikely he will consider including it.

Considering accessible electronic and information technology and universal design of computing environments requires a proactive approach. It requires thinking beyond the needs of an individual child and designing and purchasing accessible products and facilities in anticipation of participants with diverse characteristics. This is a paradigm shift. Currently, many school decision-makers consider access issues only once a specific student with a disability is enrolled. When I visit computer labs that are obviously inaccessible to many students with disabilities, the most common explanation I get from the lab manager is, "We don't have any students with disabilities right now." I then suggest that being both proactive and reactive may be the best solution. Having a few adjustable tables, creating wide aisles, offering track balls as well as mice, providing wrist rests, placing handouts where they can be reached from a seated position and assuring that Web sites they use or create can be accessed using a speech synthesizer are all examples of how they might proactively address accessibility by employing universal design principles.

Putting ideas into action

How can parents and educational professionals put all of this together to state what we should be advocating for in our schools? Here's one way to say it: We want our schools to purchase and use accessible electronic and information technology and apply universal design principles in the creation of its facilities and programs. There should also be an efficient system in place to address the assistive technology needs of specific students with disabilities as they are needed.

Now we know how to say it. That's a good first step, but building accessible information systems in our schools requires the concerted, persistent effort of parents, policy makers, information technology specialists, assistive technology specialists, teachers, and other decision makers. How can schools get started? A good place to start is with district-wide policy that clearly states a commitment to the purchase and use of accessible products, including electronic and information technology. From this, clear guidelines regarding accessible electronic and information technology can be established. Procedures should ensure that accessibility is considered in all stages of technology planning, purchases and support. Creating accessible information systems requires a close collaboration between those who serve students with disabilities and those who make information technology decisions, purchases, and provide technical support. EP

More information about universal design of instruction, electronic and information technology and computer labs can be found at the DO-IT Web site: http://www.washington.edu/doit/Resources/technology.html and at the Center for Universal Design at North Carolina State University Web site: http://www.design.ncsu.edu/ cud/univ_design/ud.htm

BOCCIA ANYONE?

by Debbie Akins

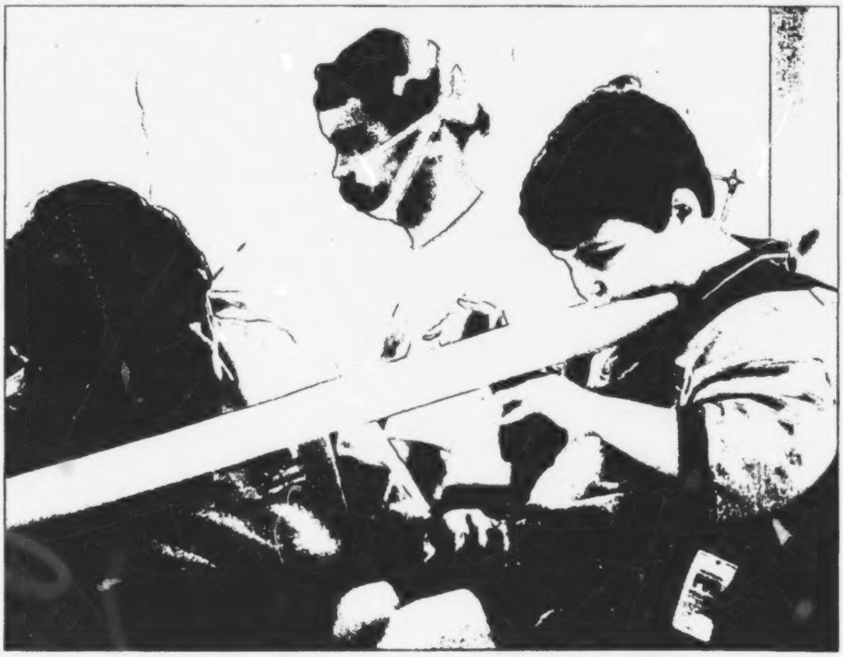
If you are looking for some simple summertime sporting fun, boccia may be just the thing. Specially created for people with disabilities, boccia is similar to lawn bowling. Competitors vie to roll their boccia balls closest to a small white marker or "jack ball." The game can be easily integrated into the classroom or recreation center for those with and without challenges. Children with the most significant limitations who cannot grasp the ball to throw it onto the court are able to play with the use of an assistive device (a ramp or chute) to aid in propelling the ball. Boccia is one of the sports that the National Disability Sports Alliance (NDSA) has adapted for competition.

Boccia requires little equipment and can be set up on any gym-type floor. The boccia court requires an area that is 6 meters wide and 12.5 meters long, about the size of half of a volleyball court (see figure on pg. 83). One set of boccia balls includes six blue balls, six red balls and one white jack ball. Modern boccia balls are made of leather which makes them easier to grasp than the original wood or plastic models. The balls are approximately 3.5 inches in diameter and weigh 275 grams (just over half a pound).

The game can be played in individual competition, where two competitors go head to head, in teams or in pairs. In head to head competition, players alternate throwing out the jack ball to start a round. The first competitor throws out the jack ball and then throws out the first colored ball (red), attempting to get the red ball as close to the jack as possible. The other competitor then throws out the blue colored ball and attempts to get it closer to the jack than the red ball. Order of play is determined by the placement of the balls. A player throws until his or her boccia ball is closer to the jack than the opponent's ball. Play continues until each competitor has all six balls on the court. The score is then calculated by determining which competitor's boccia ball is closest to the jack ball and then counting how many of that competitor's boccia balls are closer to the jack than the nearest ball of the other color. A game consists of four rounds.

Team competition: A team

continued on page 66



Zach Wooley of Lakeshore, AL lines up his shot with the help of his assistive device and the encouragement of his coach, Treva.

continued from page 65

consists of three players. In team play, each of the three players throws two balls. Play continues just as in individual competition with the members of the team determining which player is to throw next. Team games consist of six rounds.

NDSA PROUDLY SPONSORS BOCCIA ATHLETES REGIONALLY, NATIONALLY AND INTERNATIONALLY.

Pairs competition: A pair consists of two players, each player throwing three balls. A pairs game consists of four rounds.

Players are required to stay within their playing box during play. The game not only involves use of arm muscles, grasp, release and aim, but requires the competitors to develop a strategy to prevent their opponents from scoring. In addition to the competitors themselves, therapists and teachers also love the game as a way to supplement school based programs. This game is played at a recreational level around the world. Additionally, there are regional, national and international competitions for boccia.

Circle #66 or visit www.eparent.com/adinfo

For athletes who are not able to grasp and release the ball due to weakness, lack of available movement or poor hand control, assistive devices may be used. Generally, a competitor will begin with something quite basic like a five foot piece of four inch PVC pipe cut in half to make a half-circle trough. The competitor directs an assistant, who sits with his back to the court, how to aim the chute. The directions may be verbal, through eye gaze, hand movements or utterances. Once the chute is aimed to the competitor's satisfaction, the ball is placed in the chute where the competitor can release it. Release may be with the hand, chin, headstick or handstick. The competitor must be in control of the ball at the time of release. The chute can be angled to aim the ball and can be raised or lowered to control the speed of the ball when it is released, determining the distance it will travel. As competitors gain skills, more specific assistive devices are usually made to allow them better control. Each competitor can determine the design of her device as long as it meets rule requirements and the competitor is able to control the release of the ball.

NDSA proudly sponsors boccia athletes regionally, nationally and internationally. Most recently, a team traveled to Portugal in June to compete in the World Championships. These athletes love to discuss boccia and would be happy to share their experiences with you or your child. The NDSA or one of the athletes can be contacted via e-mail (boccia@ev1.net) or by mailing questions to NDSA at the address below. Additional information on boccia, boccia rules, beginning assistive device ideas and pictures of some of the athletes in action are available from NDSA. EP

Debbie Akins has been NDSA's Boccia Sports Manager for the past 10 years. She has been coaching boccia since 1983 at a local, national, and international level. By profession, Debbie is an Occupational Therapist practicing in Ft. Worth Independent School District.

R.E.A.L. Design Introduces VIVO™
The New Multi -Therapy Pony

Children will love VIVO, the playful, spirited little pony with the head that bounces when moved and a colorful beaded tail. Parents and therapists will appreciate the valuable skills children gain by playing on VIVO because it functions as a balance rocker or gait trainer by simply interchanging the legs which snap on and off easily. As a rocking horse, VIVO promotes balance reaction skills and upper body postural development. As a gait trainer, it provides incentive for a child to learn ambulation skills. The soft upholstered seat back, with molded laterals, is height adjustable to position children comfortably and securely for rocking or learning to walk. Accessories are available for adapting VIVO to a child's positioning needs.

Way to Go: Positive Reinforcement Programs For Your Child with Attention Deficit/Hyperactivity Disorder (ADD/ADHD)

by Jeanne A. Marron, PhD

There are many undesirable behaviors that you may want to decrease in your child. However, it is often better to try to find a way to increase a desirable behavior that may be an alternative to the undesirable behavior. For example, you may want to decrease the time that your child takes in resisting sitting down and doing homework. Another way to look at this is to increase the desirable behavior of sticking to a schedule and therefore sitting down to do the homework in a specified amount of time.

REINFORCEMENT

Reinforcement is something that is designed to increase behavior. There are two types of reinforcement: Positive and Negative. Positive reinforcement increases behavior when you add or give something following the behavior. Negative reinforcement increases behavior when you take something away following the behavior.

DEFINING BEHAVIOR: WHAT IS THE TARGET

The first step in setting up a positive reinforcement system involves defining the targeted behaviors.

GUIDELINES FOR DEFINING TARGET BEHAVIORS

I. Whenever possible, try to define the behavior in positive terms. (see chart below)

II. Narrow your range of focus

Be selective in identifying your target behaviors. Trying to change too many behaviors at one time is likely to fail. When selecting target behavior(s) think of the importance in terms of the following factors:

- Functional level - Where is the child in terms of behavior? What is the child able to do? If your goal is to be able to enjoy going out to a restaurant but one of your child's behaviors is the inability to stay seated at a table for more than five minutes, then changing the behavior must begin at that level
- Importance of that functional level - Prioritize according to your values. Does the behavior interfere with goals set for the child? You have decided that you want your child to have more academic success therefore it is impor-

DEFINING DESIRABLE BEHAVIORS

Here are some examples of to re-defining the undesirable behaviors in terms of desirable behavior:

UNDESIRABLE BEHAVIOR:	RE-DEFINITION:
Nail biting	Lets nails grow; Keeps fingers out of mouth
Fidgets	Stays still in chair for 10 minutes
Talks on and on	Keeps focused on one topic long enough to express a thought or need
Disorganized	Remembers to bring homework home

Ask the Doctor addresses issues of concern to our readers. Parents should review any suggestions made in this column with the appropriate professionals. Mention of specific products or medications illustrate suggestions and are not endorsements of any specific products. Send questions to: Ask the Doctor, Exceptional Parent, 65 East Route 4, River Edge, NJ 07661; Fax: (201) 489-0074; or E-mail: epedit@aol.com.

DEFINING BEHAVIORS IN SPECIFIC TERMS

Breaking down behaviors into their component parts and re-defining them in positive terms is often helpful.

Behavior	Sub-behaviors (broken down into specific behaviors)	Re-definition (the desirable behavior)
Always on the go	a) Fidgets b) Gets out of chair five times in 10 minutes	Stay still in chair for 10 minutes

tant to get the child to focus.
Therefore, sitting quietly in class

- Quality of life - Whose quality of life are you trying to improve? Will changing this behavior alter life positively? If your child wants to participate in team sports but their behavior is affecting involvement with others, changing the behavior is important for the child's success. If you see academic success as an important goal, but your child would rather spend time involved in sports, your goal will be harder to accomplish because there will be a conflict.
- Practical issues - Factors such as time and ability to monitor behavior should be taken into consideration when targeting a behavior to change. For example, if the behavior you choose to improve or change occurs mostly in school, you will not be able to monitor it directly.
- Detail - Be very specific when defining the behavior. This may involve breaking larger behaviors into smaller parts and working on them one at a time.

III. The target behavior has to be measurable

The behavior has to be something you can truly assess in terms of change. This may involve the number of times something occurs or the amount of time something lasts or the frequency of it.

- Measuring Behavior - In order to see changes in behavior(s) you need to have a clear sense of the baseline, or what is "normal" for your child. How often does the behavior occur now? How often would you like it to occur?

SELECTING REINFORCEMENTS

In selecting reinforcements, use what already motivates your child. This does not have to be a material thing, but can be time on a preferred activity. Be aware that what motivates children one day may not motivate them the next.

You may want to have a variety of reinforcement available. For example, selecting from a bowl of activities, or a point system that earns different prizes. When possible, have your child play a role in selecting the reinforcements.

SELECTING REINFORCEMENTS

Think about your child's likes and dislikes and use what already motivates your child. Make a list of five things your child likes and a list of five activities he or she enjoys. A reinforcement does not have to be a "prize." It could be time playing a game with you, time on the computer, a trip to the library, etc. Remember that what motivates a child one day may not do the trick next week. You may want to put together a "treasure box" for variety, or provide other methods of choice. Be practical - reinforcements are meant to motivate and do not have to be expensive or elaborate.

DESIGNING A REINFORCEMENT PROGRAM FOR VARIOUS AGE LEVEL CHILDREN

Different age levels require different systems. Younger children work best with systems that furnish a very short delay between the behavior and the reinforcement. As a child ages, the reinforcement system can become more complex, with longer delays between behavior and reinforcement.

Try to get your child to make a "contract" to try the system. The greater the child's involvement in setting up the system and affirming efforts to comply, the more likely it will be for the system to succeed.

For all ages, pair the reinforcement with positive verbal feedback. This is the route to internalization. You want your child to take pride in his or her accomplishments. It is this internal sense pride that will carry the behavior forward in the future.

REVIEWING AND FINE-TUNING YOUR REINFORCEMENT PROGRAM

Be patient and give your system a fair trial. Identify a "review day" to assess your system. If it is not working, do some trouble shooting. What factors are interfering? Were you being realistic in the target number of behaviors needed to earn the reinforcement?

If it is working, continue the system for another period of time and if needed, alter the system. Wait to gain suc-

cess in one behavior before targeting another.

THE ABCS OF BEHAVIOR: BECOMING AN OBSERVER OF YOUR CHILD'S BEHAVIOR

ANTECEDENTS: What led up to the behavior? What was the situation or context in which the behavior occurred?

BEHAVIOR: What is the behavior? Specify exactly what behavior occurred.

CONSEQUENCES: What happened in response to the behavior? What was the response of you or others to the behavior?

Positive reinforcement systems target behavior through positive consequences aimed at increasing the desirable behavior. Remember to examine the the antecedents of a behavior as sometimes the context needs to be altered for the behavior to change.

MAKING IT WORK

These are just some basic tools for structuring a reinforcement program. You and your child may be able to find new tools to help you accomplish your goals together. Be sure to approach the positive reinforcement program with a positive attitude and make it a fun and successful experience for your child. EP

The Double Whammy:

Tourette Syndrome and Associated Disorders as They Impact Families

by Jan Blacher, PhD

You've probably seen the motor or vocal tics in characters on the TV shows Ally McBeal or The Practice. You may have seen them displayed by children or adults at the local mall, or at school or even on a college campus.

If you're a die-hard baseball fan, it is likely you know about professional baseball player Jim Eisenreich (EP's Role Model Feb. 1997):

"His troubles began when he was eight. Jim was a good ball player. But sometimes, while he was playing, his body would start twitching. His neck jerked and his arms thrashed wildly. His eyes, nose, and mouth twisted into the funniest faces."—(from The MacMillan Baseball Stories, "All Eyes on Eisenreich" Egan, Friedmann, & Levine, 1992, p. 97)

I am calling your attention to a disorder known as Tourette syndrome (TS) or, Tourette's disorder. The disorder is characterized by vocal and motor tics. Although the tics associated with TS can sometimes be frequent and severe, more often they are not. TS typically occurs in children who are of normal intellectual functioning, and who are aware of their often bizarre behaviors.

What is Tourette Syndrome (TS)?

Complete descriptions of TS are provided on the Tourette syndrome Association Web site (see pg 77) and in the American Psychiatric Association's most recent Diagnostic and Statistical Manual of Mental Disorders (known as the DSM-IV). The APA defines a tic as "a sudden, rapid, recurrent, nonrhythmic, stereotyped motor movement or vocalization." The main criterion for diagnosing TS is the occurrence of multiple motor tics and one or more vocal tics that occur throughout a period of more than one year. By definition, though, TS must have its onset by age 18. Finally, tics associated with TS cannot be due to the effects of a medication (e.g., psychostimulants like methylphenidate) or some other general medical condition (e.g., post-viral encephalitis).

Many individuals associate TS with the random uttering of obscenities; indeed, this has received the most focus in the media and, unfortunately, in the general vernacular. Ironically, this symptom of TS, known as "coprolalia," occurs in less than 10 percent of people with TS, and is not even a criterion for the diagnosis of the disorder. Slightly less alarming than coprolalia are various other vocal tics (e.g., growls, grunts, coughs, sniffs). Most common are simple motor tics, such as eye blinking. Complex tics include touching, twirling when walking and deep knee bends. Tics always vary over time in their number, frequency, anatomical location, complexity and severity.

The process of distinguishing TS from other disorders, or differential diagnosis, can be complicated because of the many disorders that are similar in appearance and type. In fact, the diagnosis of an individual can change over time, from a transient tic disorder, or chronic motor or vocal tic disorder, to TS. However, according to Eric Saslow, a neurologist at UCLA, the management of these related disorders would be similar. Although tics are considered involuntary, many individuals with TS have some control over their symptoms and can suppress tics, at least for a time; eventually, most individuals with TS do have to release their symptoms. Dr. Saslow notes that this situation, unfortunately, leads some people to believe that tics are actually "voluntary" and could be controlled, if only an effort were made.

How many people have TS?

According to the DSM-IV, TS affects all racial and ethnic groups. It has been reported in children as young as 2 years of age, though the onset of tics is most often reported around age 6 or 7. While TS appears in adults at the rate of about one or two per 10,000, children are affected at the rate

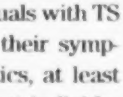
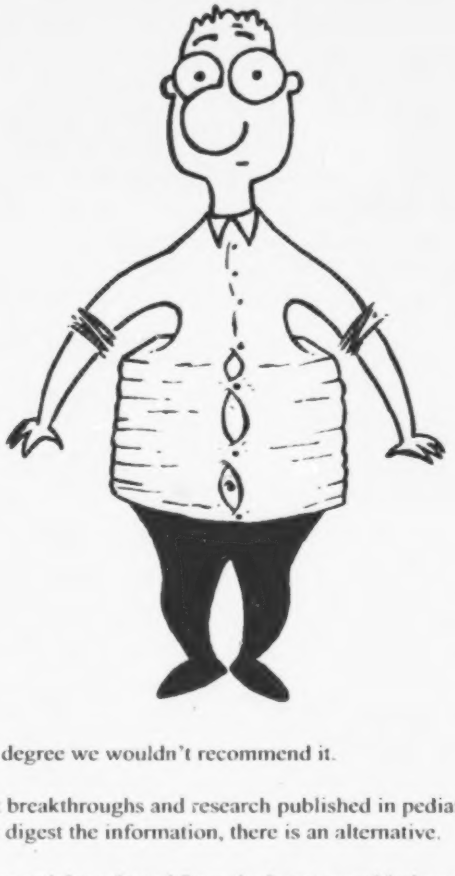
Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, where she has been a researcher for 20 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of mental retardation, dual diagnosis and the transition to adulthood. Dr. Blacher has developed **Research Reflections** as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to **Research Reflections** and any suggestions you might have. Send e-mail to: jan.blacher@ucr.edu.



As our volunteer clearly demonstrates, 21* pediatric medical journals can be quite difficult to digest.



In fact, unless you have a medical degree we wouldn't recommend it.

If you have an interest in the latest breakthroughs and research published in pediatric journals, but don't have the medical training required to easily digest the information, there is an alternative.

ChildHealthMonitor.org publishes articles adapted from the latest monthly issue of each of the world's leading pediatric publications*. The information is the same. The difference is that much of the medical jargon is replaced with everyday language. It's also online which means that anyone with an Internet connection can now have instant access to reliable, useful information on the latest advances in treatment, prevention, and caring for kids.

Simply, visit **www.childhealthmonitor.org** and you too can have unlimited access to hundreds of simply written articles on up-to-the-minute pediatric discoveries.

We think you'll find this option much more palatable. (Our volunteer did.)

research reflections

continued from page 72

of 5 to 30 per 10,000. The National Institutes of Health estimate that 100,000 Americans have full blown TS; this could be even higher if individuals with chronic tics or transient childhood tic disorder are also included.

Some claim that TS seems to be more common among school children today, and shares dramatically increasing rates associated with autism and attention deficit hyperactivity disorder (ADHD). Indeed, in a study published in 2001 in the journal *Neurology*, by Roger Kurlan and colleagues, the rate of TS among school children in the general population is cited as 50 to 75 times higher than has been traditionally thought. The investigators examined 1,596 school children and found that about 27 percent of those in special education had some kind of tic disorder, with seven meeting diagnostic criteria for TS. Twenty percent of regular students demonstrated tics, with almost 4 percent meeting diagnostic criteria for TS.

Double Whammy: What other disorders are associated with TS?

As if Tourette syndrome weren't challenge enough, these children often must struggle with adverse social reactions, learning difficulties, and even additional psychiatric disorders. Research suggests that the social and emotional difficulties that often go along with TS are more problematic for daily adaptation than the motor and vocal tics. Diane Shader Smith, a mother of a child with TS, realistically portrays what life is like for a ninth grade boy with Tourette syndrome in her novel, *A Test of Will:*

"English was easily his worst subject, largely because Will found it almost impossible to read a chapter from his lit book. Will blamed his reading difficulties on his Tourette Syndrome, a neurological disorder he'd been diagnosed with in third grade that was characterized by motor and vocal tics. It was a strange disorder, Will often thought, because it caused all kinds of other problems that had nothing to do with tics."—(Smith, 2002, p.3)

Two disorders often associated with TS are attention deficit hyperactivity disorder (ADHD) and obsessive-compulsive disorder. In one study, conducted in Sweden, Bjorn Kadesjo and Christopher Gillberg documented the types and numbers of disorders that

Never in my Wildest dreams...

"WHEN I FIRST CAME TO CROTCHED MOUNTAIN OVER 10 YEARS AGO, activities that were second nature prior to the automobile accident were challenging tasks. Today I am a college graduate and also have my drivers license.

Never in my wildest dreams would I have been able to do half of what I've achieved without the encouragement and help that I received at Crotched Mountain! I want to thank everyone at Crotched Mountain for helping me get my life back!"

co-existed in children with TS. They screened a clinic sample of 58 children already registered as having TS at a county-wide tic disorder clinic. Two-thirds of the clinic sample met criteria for ADHD. Two-thirds also scored above a cut-off on a screening instrument for Asperger's disorder or high functioning autism. The authors suggest the intriguing possibility that TS may also be under-diagnosed in those with pervasive developmental disorders (such as high functioning autism) because tics may be misdiagnosed as repetitive, stereotyped behaviors associated with autism.

Researchers refer to the appearance of multiple disorders as comorbidity. From the perspective of their impact, on both the child and his or her family, having TS plus another significant disorder constitutes a "double whammy."

How does TS impact families?

Researchers have studied the impact of TS, and they have done so in a variety of ways. School functioning of children with TS is clearly affected. In several studies, teachers have reported that children with TS are less popular and more withdrawn than control children (i.e., those with no known disorder). Other researchers have compared the impact of TS without any comorbid disorders to the impact of TS plus some other disorder.

One disorder in particular that has a negative impact on the child's functioning at school and on family functioning at home is ADHD. Children with ADHD are characterized as having difficulties with self-regulation, including inattention, hyperactivity and impulsivity. Children with ADHD without TS, often have social and peer difficulties, higher rates of conduct problems and aggression in school, and generally poor adaptive behavior skills. Not surprisingly, then, the combination of ADHD and TS results in greatly heightened family stress.

Alice Carter and her colleagues at Yale University studied how TS affected family functioning. Their findings, published in the *Journal of Child Psychology and Psychiatry* in 2000, were enlightening. They compared three groups of children: No TS, TS alone, and TS with comorbid ADHD. The children with TS, even without comorbid ADHD, had more school and attentional problems than the control (no TS) children. This makes sense, of

continued from page 75

course, because children with TS have motor inhibition difficulties and are often distracted while trying to suppress their tics in school settings.

Carter's group further found that parent-rated child attentional problems and the range of maladaptive behaviors were highest in the TS + ADHD children, followed by TS alone, and then control children. We might, then, infer a continuum of impact on families, a finding corroborated by other studies examining negative family impact in the presence of TS and co-existing disorders. In turn, as Carter had hypothesized, lower family functioning was associated with poorer social emotional adjustment in TS children, and more so when the child had comorbid ADHD.

Is the "Double Whammy" unique to TS?

Unfortunately, the answer is "NO." Children with an intellectual disability are at an especially high risk for behavior problems and a diagnosed mental disorder. In children with a primary diagnosis of mental retardation, this type of "double whammy" is called dual diagnosis. Most of the work on dual diagnosis has pertained to older children or adolescents, with reported prevalence rates of a psychiatric diagnosis (e.g., ADHD, OCD as noted above) three to four times those found in the typical population. Recent studies are beginning to find heightened rates in young children as well.

In our own work, conducted with Bruce L. Baker at UCLA and Keith Crnic and Craig Edelbrock at Penn State University, the emergence of the "double whammy" in children as young as 36 months of age was found. Children with developmental delays were three times as likely as their non-delayed peers to score in the clinical range on the Child Behavior Checklist, a commonly used instrument for assessing behavior problems. These behavior problems, scored by mothers and fathers, were stable over the year from 36 to 48 months.

Parenting stress was higher in the families of children with developmental delay, similar to findings from families of children with TS and from studies of families coping with many other disabilities. A lingering question has been whether heightened family stress represents a chronic reaction to intellectual disability per se or a reaction to

340

the often-associated behavioral challenges that these children present. In our analyses, child behavior problems were a much stronger predictor of parents' stress than the presence of or degree of cognitive delay. Furthermore, we found that over time, an interactional process was occurring, similar to Alice Carter's findings with TS families: High levels of parenting stress contributed to a worsening in child behavior problems over time, and high incidences of child behavior problems contributed to a worsening in parenting stress.

What are the implications of recent research for families?

The finding that parenting stress is related much more to child behavior problems than to the core symptoms of disorders like Tourette syndrome should be good news to service providers for several reasons. First, there is considerable evidence that behavior problems can be reduced successfully through psychological and pharmacological interventions. Second, knowing that there are greater social and emotional risks to families associated with TS, professionals can be on the lookout for evidence of family stress, and they can monitor such stress to be sure that families are coping adequately. They may also want to suggest family counseling or support services. Third, social skills training for children and adolescents with TS can help to improve peer relations and friendships. Finally, and more broadly, school-based interventions could help to reduce the stigma associated with tics.

A list of resources mentioned in this column may be obtained by e-mailing requests to: epedit@aol.com.

For more information on Tourette syndrome, see the following Web sites:

Jim Eisenreich Foundation for Children with Tourette Syndrome:
http://www.tourettes.org

Tourette Syndrome Association
http://www.tsa-usa.org

In closing...

More good news is that Jim Eisenreich finally found a doctor who diagnosed his tics and twitches as Tourette syndrome, and he received medication that all but eliminated them. In 1989 he was voted the Kansas City Royals' most valuable player.

The boy, Will, in the novel excerpted here, achieved academic and social success, and even captured the attention and affection of the girl of his dreams! EP

PART XIII

Sports Injury Prevention and Trauma

by Manfred Friedman, DDS

Traumatic injuries to the teeth are among the most common and disturbing injuries to occur in children and adults with developmental disabilities. Although a significant number of injuries in both children and adults with developmental disabilities result from ambulatory and seizure disorders, these injuries can take place during some forms of sporting activity. It is important to understand that not all injuries will occur in formal sports. Children will often injure themselves during a friendly hockey game on a local street or while shooting hoops. Injuries can range from a small crack in the tooth enamel to complete avulsion (pulling out) of the tooth from the mouth. This article will deal with prevention of injuries during sporting activities, first-aid treatment that can be administered to the person before visiting a dentist and some of the recent techniques used to restore broken teeth.

Prevention of injuries to the teeth

Injuries to the teeth will happen most often when children are playing in either an organized sporting activity or during casual play with their friends. During casual play it is very difficult to prevent injuries as contact generally occurs randomly. Usually the child will fall and hit his/her face, lacerating tissues and often damaging a tooth or teeth. You can only advise your child to be careful when playing; should an injury occur, seek treatment immediately, especially if a tooth has been knocked out of the mouth. Children with very protruding teeth, such as those often seen in individuals with Cerebral palsy, are more prone to injuring their teeth after experiencing a blow to the face and teeth. When possible, the child should have orthodontic treatment to straighten and align the teeth. If the child or adult has an ambulatory or seizure disorder and is prone to falling, the use of a face protector should be considered. Fortunately, the majority of these disorders are controlled with medications, reducing the incidence of injury to the face and teeth.

Organized sporting activities

Any child or adult who is engaged in organized sporting activities which may result in contact with another athlete during the activity should wear a mouth guard to prevent injuries to the teeth and supporting soft tissues.

Mouth guards

Mouth guards are thin, flexible u-shaped pieces of plastic that are worn over the upper teeth when playing any contact activity, such as floor hockey, basketball, soccer, rugby, football, karate, tai-kwando, judo and boxing. Research has shown that these mouth guards act as shock absorbers when the person suffers a blow to the jaws. The primary function is to prevent injury to the teeth, temporomandibular joints and soft tissues; even more important, it has been demonstrated that concussion injuries to the brain can be prevented by wearing a mouth guard. All parents should insist that any child who is involved in a contact sport be fitted with a mouth guard.

Mouth guards can be either custom-fitted by your dentist or purchased off the shelf at the local sports or drug store. To have a custom guard made, the child visits the dentist, who will take a mold of the upper jaw. This mold is sent to a dental laboratory where the mouth guard is vacuum-formed to the mold. The completed mouth guard is then placed over the teeth and because it fits very well, is very comfortable. High-quality off-the-shelf mouth guards that also function very well—the "boil and bite" variety—are available. The mouth guard is placed in boiling water to soften the plastic, then placed over the teeth of the person, who is instructed to bite down gently and suck in on the mouth guard. This adapts the guard to the teeth. The guard is then removed from the mouth and placed in cold water to set the plastic. While this type of mouth guard is not ideal, those of higher quality are acceptable alternatives to the custom-fabricated guard. The important thing is that the person must wear the mouth guard. Consult your dentist, who will advise you on the best type of mouth guard for your child. The dentist can custom design a guard depending on the type and nature of the sporting activity.

Treatment of injuries to the teeth

Any time a person has suffered an injury to the face and teeth, it is very important to determine if s/he has lost consciousness. If this is so, even if everything appears perfectly normal, take the person immediately to the local emergency room for examination. Remember that you might not see the injured person until some time after the accident. Once it has been determined that the person did not lose consciousness, any injury to the soft tissues of the face and teeth can be dealt with.

The Avulsed Tooth

The most severe injury to the teeth is the avulsion, occurring when the tooth has been knocked out of the mouth. If a primary (baby) tooth is accidentally avulsed, do not put it back in the mouth. The correct treatment is not to attempt to replant it, but to seek immediate dental attention and address the injury. If a permanenttooth is lost, time is of the essence in treating this type of injury. The longer the tooth is out of the

continued from page 79

tooth socket, the less chance it will have to be treated successfully. The best treatment is to replace the tooth in the socket immediately and visit the dentist for further treatment that might involve stabilization. If the tooth has fallen in dirt, it should be washed off—holding the tooth by the crown only—and then replaced in the socket. Again, go straight to the dentist. Do not be concerned if you put the tooth in the wrong way; the best place to store the tooth is in its own socket, root side first. If you are uncomfortable placing the tooth back in the socket, place it in a glass of ice cold milk. If the person is high functioning you can place the tooth under the tongue or in the cheek pouch; saliva is an excellent storage medium. You must instruct the injured person to be very careful not to swallow the tooth. Proceed to the dentist or emergency room, where the tooth will be placed in a special preserving solution until the person can be treated.

Do not wrap the tooth in a dry handkerchief or piece of plastic; it is very important that the tooth remain moist during its trip to the emergency room or dentist. If you are in a facility which has a special "tooth saver container" for avulsed teeth, place the tooth in the container and go to the dentist immediately. Time is critical. The biggest problem with a tooth that has been avulsed is that the tissues on the root surface become dehydrated, greatly reducing the chance of successfully replanting the tooth.

Repairing broken teeth

For teeth that have been chipped, try to locate the broken piece, place it in water and take it with you to the dentist. The piece can sometimes be bonded onto the tooth, restoring its aesthetic appearance. If you cannot find the piece, the dentist will be able to repair the tooth almost to its original color and shape using current bonding techniques. If the piece is lost and the person has a lip laceration, an x-ray may be necessary to ensure that the piece is not embedded in soft tissue.

Bonding

The dentist will clean the broken tooth surface very well with a mild acid, which prepares the tooth surface for bonding. The dentist will then

Anderson School

Building A Tradition of Service for Over 78 Years

Anderson School provides the highest quality programs possible for children (ages 5-21) and adults with autism and other developmental disabilities. Anderson School is an educational residential community committed to an ongoing and fully integrated support network for their families and guardians. As an organization, Anderson School constantly strives to provide an enriched and positive climate filled with educational, cultural and recreational activities designed to foster continuous growth, independence and social interaction.

Located near historic Hyde Park (approximately 95 miles from midtown Manhattan) on a scenic 100 acre wooded estate overlooking the Hudson River, Anderson School serves all of New York State and welcomes out of state applications.

apply a bonding agent to the tooth and cure it with a special curing light. Now the tooth can be built up with very life-like materials, duplicating the shape and color of the original tooth. In most cases it is almost impossible to distinguish between the natural tooth and bonded repair. The repairs can often be made without the use of a local anesthetic, as the tooth does not have to be drilled at all, and the procedure is almost painless. However, if the nerve (pulp) of the tooth is involved, the dentist may have to use local anesthetic before treatment. Today "nerve treatments" (root canals) can be completed very rapidly thanks to advanced technology and materials. In a young child who has damaged a tooth and exposed a nerve, the treatment will normally take one or two visits. Following the nerve treatment, the dentist will restore the tooth to its normal function and appearance.

Sometimes a tooth may darken or discolor following trauma. If the tooth is a primary (baby) one, treatment is determined by the age of the patient and the development of the dentition, as this tooth will eventually be replaced by its permanent successor. A permanent tooth can be bleached, or even veneered, using bonding to restore its original color. If the tooth is very dark a porcelain crown or cap may be needed.

Implants

Today a person who has avulsed a tooth which cannot be replanted, or sustained a severe injury rendering the tooth (or teeth) non-restorable, can have it replaced with an implant. An implant can be likened to an artificial root that is imbedded in the bone, then covered with a crown to replace the tooth that was lost. Unfortunately, this treatment is only suitable for persons 18 years of age and older, because the jawbones have to complete their growth before an implant can be placed successfully. This treatment is especially useful for someone who has lost a single front tooth, as this treatment avoids cutting the adjacent teeth down to place a bridge. Bridges are an alternative method of replacing lost teeth. The teeth on either side of the lost tooth are reshaped by the dentist so that crowns can be placed on the

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in EXCEPTIONAL PARENT.

How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly.

Be sure to tell them you saw their ad in EXCEPTIONAL PARENT!

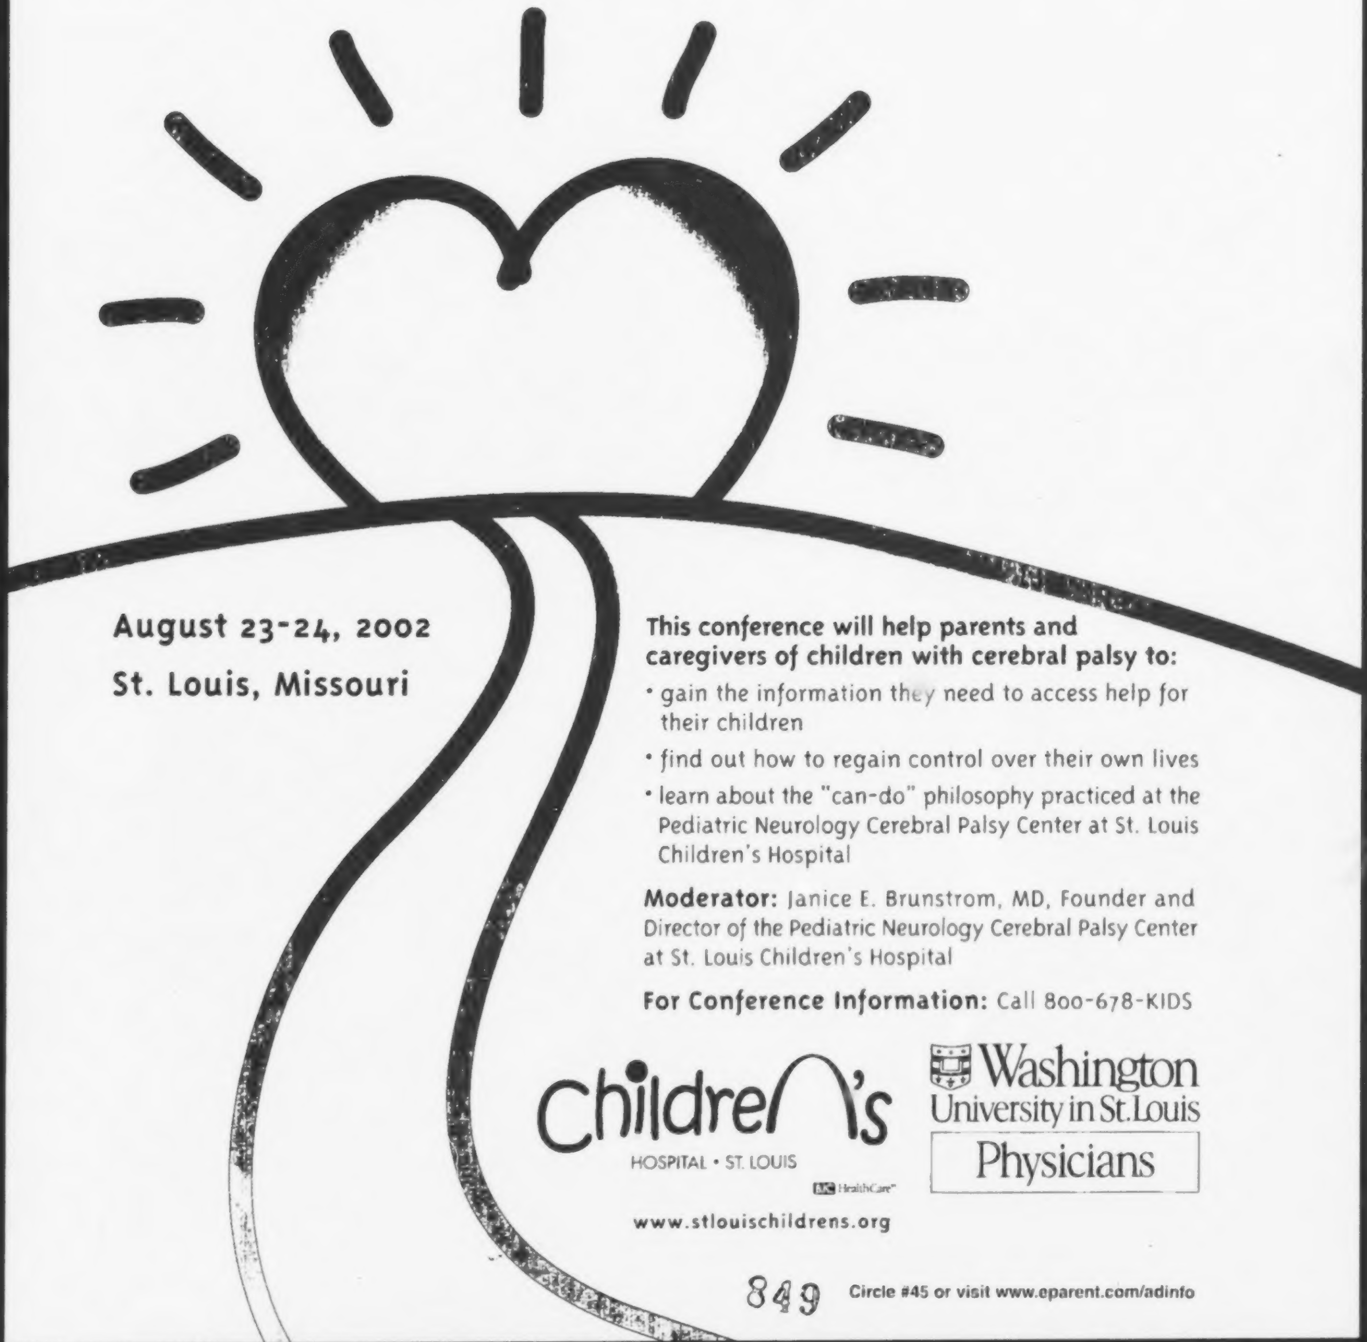
Building The Road to Independence

A Conference for Families of Children with Cerebral Palsy



August 23-24, 2002

St. Louis, Missouri

This conference will help parents and caregivers of children with cerebral palsy to:

- gain the information they need to access help for their children
- find out how to regain control over their own lives
- learn about the "can-do" philosophy practiced at the Pediatric Neurology Cerebral Palsy Center at St. Louis Children's Hospital

Moderator: Janice E. Brunstrom, MD, Founder and Director of the Pediatric Neurology Cerebral Palsy Center at St. Louis Children's Hospital

continued from page 81

teeth. The two crowns are joined by a false tooth and the whole bridge is cemented onto the prepared teeth. This type of restoration is very good as long as the patient has very good oral hygiene. Other important considerations about implants are significant cost and the high level of patient cooperation required for the procedure.

The use of dentures to replace teeth in a person with developmental disabilities must be carefully evaluated, especially in those individuals with seizure disorders, as dentures can be displaced during a seizure episode. Your dentist will be able to evaluate the best replacement method for the individual.

If the tooth remains in the socket but has been knocked out of alignment, you can try to reposition it if the child or adult will allow you to do so. The best time is immediately after the accident, as the person will be a little shocked and will still allow you to touch the teeth. Again, visit your dentist as soon as possible. If your dentist is not available, take the person to the local emergency room. Unfortunately, emergency rooms are notorious for keeping patients waiting if an injury is not life-threatening, and sometimes this wait can compromise the success of treatment.

Remember, once the teeth have been repaired it is important to visit the dentist for regular follow-up visits to check that the teeth are functioning properly and healing well. It is not uncommon for the nerves—not only in the injured teeth but in the adjacent teeth—to deteriorate following trauma, so follow-up is very important. If the initial repair was made at an emergency facility or while away from the area, please be sure to tell your dentist that the person has had a traumatic injury to the teeth. The dentist will then take x-rays as necessary to monitor the traumatized teeth over time. **EP**

Manfred Friedman, DDS, is an Assistant Professor in the division of operative dentistry and endodontics at the School of Dentistry, University of Western Ontario, London, Canada. He is also the Director of Dentistry at the South-western Regional Center and has a private practice limited to endodontics in London.

The Serena Merck Memorial Award

for Innovation and Dedication in Practice 2002

Purpose of the Award The Serena Merck Memorial Award is given annually to an exceptional individual who has demonstrated long-term, selfless dedication and compassion in the care or service to children who have retardation and significant mental health problems. Mrs. Merck recognized the critical importance of what quality day-to-day care provided by committed individuals can make to children with cognitive and behavioral disabilities. The John Merck Fund has established this major, national award to honor her long-standing commitment to this field, and to call attention to the invaluable role caring individuals play in it.

Criteria for Selection of the Awardee Prospective awardees should meet one of the following categories: (1) Provides, as an employee or volunteer, services for children who have mental retardation and significant mental health problems. (2) Demonstrates long-standing commitment and innovative care of this population which has positively affected their quality of life and/or life opportunities.

Submission Guidelines Organizational entities may nominate prospective awardees. One nomination per organization is permitted, although multi-service organizations may submit one nomination from more than one service unit. No self-nominations are acceptable. Only organizations serving children with mental retardation and significant mental health problems are eligible to nominate an individual. A 500-word summary of the reason the candidate is nominated, length of service in the field, and a description of the person's impact on children with mental retardation and significant mental health problems is required. At least two, but no more than five, accompanying letters of reference from individuals well qualified to evaluate the candidate's suitability for the award should be provided.

Nominations should be mailed before August 1, 2002, to:
Mr. Frank Hatch, The John Merck Fund,
11 Beacon Street, Suite 1230, Boston, MA 02108

Award A $5,000 cash award and plaque will be presented to the awardee at the 19th Annual National Association for the Dually Diagnosed (NADD) Conference held October 23–26, in Denver, Colorado. The awardee's travel expenses to the conference will also be covered.

Special Report | Part II: The Decision and The Battle

by Lauren Agoratus

The Center for DISCOVERY

INFORMING

EMPOWERING

AND KEEPING PARENTS INVOLVED

Sometimes battle lines are drawn when parents of children with special needs fail to get the services to which they are entitled. Parents who overcame the numerous obstacles that confronted them share their strategies and successes.

Working within the system but being aware of the fact that persistence pays off is often the key to success. However, to do this, many parents need to cast aside prior notions of politeness and deference in order to obtain needed services for their children.

Early on, parents are buffeted by the trauma of discovering, the special circumstances of their child. Physicians, healthcare professionals, social services providers and family are all offering advice, comfort and support. To many parents, the entire process is overwhelming.

They sometimes develop a sense of courtesy and dependence on professionals that may not continue to be in the best interests of their child.

Starting Out

The support and experience provided by other parents of children with disabilities are often vital for those who are just starting out. Pat Tavis of New Jersey has two sons, both of whom have special needs. Her son Ryan, 10, has autism and her other son Christian, 5, has Asperger syndrome (pervasive developmental disorder). From the time Ryan was diagnosed until he reached the age of three, he was eligible for and received early intervention services. When Ryan completed early intervention, Pat's school district then offered a half-day preschool disabled program for him.

Pat knew a half-day would not be enough to help her son, but had to learn how to advocate for what he needed. By joining various support groups where she networked with other parents, she learned about her son's rights. Pat presented the school district with reports from the early intervention teacher recommending a full day. With those recommendations she was able to fight for a full day program at the Developmental Learning Center in New Jersey. She later did the same for Christian by getting reports from his teacher as well as from his speech and occupational therapists. Pat wants other parents to know that there are choices. If school personnel are unable to write a letter that disagrees with the position taken by the Committee on Special Education (CSE) an evaluation and recommendation by an independent educator or clinician may be necessary.

Getting the Right Support

When Monica Ramos of New York realized that her son Jesse wasn't progressing in school, she took a closer look at his Individualized Education Plan (IEP). She found that the school hadn't updated his goals annually. Over four years, they had merely used "white-out" on the date instead of updating it properly.

Jesse, who is blind and has autism, mental retardation, cerebral palsy, hypotonia and uses a wheelchair, wasn't getting the attention he needed. In a class of twelve with a teacher and aides, Jesse was not provided with a one-on-one assistant and was given only thirty minutes of therapy twice a week.

Monica says she couldn't believe she had trusted the system that so miserably

Strategies

Knowledge comes from attending meetings/conferences, support groups, learning resource centers, and disability specific organizations.

Many parents mentioned other parents as a primary source of information as well as matching groups such as Parent to Parent, as frequently researched on the Internet.

Recording IEP meetings and bringing an advocate along or getting information from a Parent Training and Information Center was cited as key to success.

One inventive parent sent a picture of her hospitalized baby girl on pink paper to medical billers with the message, "Hi, my name is Lizzie. My Mommy and Daddy are really busy taking care of me right now, so I would really appreciate it if you could straighten out this misunderstanding. Here is a copy of all my insurance information. Thanks!" This saved the parents many phone calls and letters and made it "real" by showing that the piece of paper represented a person.

Other options are special classes, special schools, non-public school or instructional venues.

Ultimately, it is the parent's responsibility to insure that the child is making progress and is receiving the services of sufficient quality. The best way of insuring this is maintaining a strong presence within the school system and to bring to bear attorneys, specialists and advocates to make things happen for the children.

BEST COPY AVAILABLE

continued from page 87

failed her son. She visited his class and found several problems. The teacher was pointing to pictures throughout the lesson, pictures that Jesse couldn't see. The teacher would also try inappropriate approaches, such as "This is how Tuesday feels."

"You can't feel a day of the week!" exclaims Monica. She noticed that the classroom aides, not the students, were doing the art project and saw one actually stop a child who wanted to try it by himself.

The aides were also reading and eating during class. Monica wanted better placement for her son, even if it meant placement outside the school district or in a residential setting. When she appealed formally to the school district, however, she was told "private or residential placement is not something we do," though this is a violation of IDEA, which is a federal law that covers all school districts.

Monica began doing her own research to look for the best placement for her child. She found a residential facility that would meet Jesse's needs. "I met the teachers, the program is good, and they work well with children who have vision problems," Monica said. Residential placement was not a decision she made without anguish. Initially she argued with her own mother over her decision, finally convincing her mother after a tour of the facility.

Then she went about dealing with the school district. At first, officials informed her that she had to prove they weren't providing Jesse with an appropriate education. Monica hired a lawyer who discovered, in addition to the violation of Jesse's right to an appropriate education, that the school had not followed procedure to provide Monica with a parent liaison at her meetings as required. Monica also worked with a New York parent advocacy group who appointed a caseworker to attend the IEP meetings with her and commissioned an impartial overseer to evaluate his program and assess his growth.

Thanks to Monica's efforts, an education specialist, and the intervention of an attorney, the Board of Education approved the placement. Jesse now attends the Center for Discovery, a residential facility in upstate New York. Monica advises other parents to check their child's IEP carefully, read about parents' rights and get an advocate and/or lawyer. Monica visits with Jesse each weekend and he comes home in the summer. She is confident she made the right choice for her son and notes his improvement. "Jesse is feeding himself for the first time. He can deal with noise and with people. And he's happier now."

Many other parents of children with special needs have discovered that they, too, have had to become advocates for their children.

Larry Greenstein describes his own experiences with his now 10-year-old son Kevin. The boy had birth trauma with prolonged episodes of hypoxia that resulted in cerebral palsy. At a young age Kevin presented like a kid with a pervasive developmental disorder.

When Kevin was two, Larry and his wife, Dr. Star Anthony, discovered Dr. Stanley Greenspan, a highly respected authority on developmental disorders who is a professor of psychiatry, behavioral sciences, and pediatrics at George Washington University Medical School. Larry describes Kevin's progress and his efforts below.

With his help we set up a "Floor Time" program at home. Floor Time is a way of addressing a child's developmental changes with an emphasis on following the child's lead and playing at their developmental level. Kevin also attended a pre-school recommended by the Committee on Pre-School Education.

We tried to train the preschool in the Floor Time program, but without success. So we removed Kevin from the school and placed him in a standard half-day pre-school with an aide that we paid for to help him with socialization. The other half of the day we used the Floor time program at home. The district provided a minimal amount of related services for Kevin at home, but not in sufficient quantity to be effective. They did not agree to any aide time or teacher time.

(Many parents can not afford to do what Larry did. They must continue to focus on getting support from local and state agencies.)

When the CSE met to handle Kevin's placement once he turned five, they recommended a special school. We felt that there would not be appropriate children for Kevin to model and that his social development would be stunted. We filed for Due Process hearings on both the CPSE and CSE recommendations.

Children share smiles and hugs despite their parents worries.

Our strategy was multifaceted. As a first step, we retained an attorney who told us that parents rarely win and we should expect to have to go to Impartial Hearing to get anywhere. We started calling all of the Board of Education members explaining our case and asking for their help. We also asked our local political representatives to get involved. One County legislator met with the Superintendent on our behalf and agreed to send a representative to our CSE meeting "just to observe."

At the same time we went very public. After getting copies of the district legal bills under Freedom of Information Law, (FOIL) we wrote letters to the editor of our local papers explaining the situation. We followed that up with letters from friends who wrote to the editor in response to our letters. This caused a constant stream of comment.

Once we got our story out and showed how much taxpayer money was being squandered to deny Kevin an education that is cheaper than an out-of-district placement, it was just a matter of time. The Board replaced their attorney during our Impartial Hearing. The new attorney was much more amenable to a settlement and we went that route.

Kevin is now in a mainstream third grade class. He still has many issues and struggles, but everyone in the district admits that he belongs there. The district uses Kevin as an example of how we can return kids to our schools and we are trying to bring back more kids.

Kevin won, and so did his classmates, who are learning that you can be "different" and still be a friend. Teachers are finding that teaching challenging children keeps them sharp. The parents are discovering that Special Education benefits all children.

Larry is just ending a four year stint as co-president of our local Special Ed PTA, and has spoken to many families who are involved in various disputes. The advice that he gives them is generally along these lines:

1) Don't be ashamed of your child's problems. Look for help wherever you can find it.
2) It is more important to be respected than to be liked. Know your stuff and don't back down.
3) Ask for the stars when you only want the moon.
4) Everyone needs to feel like they've won. Leave room for compromise.
5) Don't get personal. When you win, these will be the people working with your child. You will need them as allies.
6) Get involved. Be an active parent. Not only does it build support among other parents, but also among the staff, which can be invaluable.

Often times, parents are flooded with insurance bills and additional costs. The arrival of mail is often a time of heartache and despair. For many parents, the sheer effort associated with completing forms, obtaining medical records, and tracking down files lost among unseen medical paper pushers can cause extreme stress.

Lauren Agoratus talks about her own experiences in this medical and support services environment. Lauren is the parent of a child with Asperger syndrome and kidney disease. She serves as the NJ State and Region II (NJ, NY, VI, PR) Coordinator for Family Voices, a national advocacy group for children with special health care needs.

The first red flag was raised when our insurance company denied my daughter's claim for physical therapy despite that fact that is listed as a covered service in the employee handbook, a fact which we verified by phone. I fought them for a year and a half and won, only to have a claim denied for occupational therapy the next year, which took another year and a half to appeal and win.

The second flag popped up when my daughter's doctors said it was okay for her – a medically fragile, homebound child – to begin to attend school at age six and a half. Our school district wanted to bus her to a full day program for children with developmental delays that is forty-five minutes away. We decided to move so that our daughter would be in a better district.

The red flags were warnings signaling my need to become an advocate for my daughter. To be an advocate for your child means pushing to get what your child needs, oftentimes what he or she is entitled to under the law. The principal part of being an advocate is educating yourself about your child's rights and being assertive in protecting them. I have found myself constantly struggling against medical and educa-

continued on page 108

continued from page 107

tional systems that were supposed to help my family. I have also found that I am not alone.

Struggles

Sheila Donnelly says that her biggest struggles are over bills from medical providers. Her son Nathanel has traumatic brain injury. Nathanel has coverage from three health insurance sources, including Medicaid, for all the services he needs. Yet no matter how hard Sheila tries to make sure all healthcare providers who treat him have all of his insurance information and copies of his cards, because of medical billing errors she still gets bills for the balance due. The providers either don't bill the insurance carriers in the correct order, or they don't bill insurance at all. Sheila says medical bills arrive in her mailbox on a daily basis.

Successes

Donene Fiest of North Dakota is the mother of two sons; Tyler, who has attention deficit/hyperactivity disorder and learning disabilities, and Zach, who has hearing impairment. Donene has found that there is an obvious difference between disabilities that are hidden and those that can be seen. Misunderstandings arise from the "invisible" disabilities. Donene is also an advocate for others, a position she finds less taxing than advocating on her own children's behalf. "For my own, the battle is close to my heart; it is personal and can be absorbed into a parent's soul," she says. Donene found that the bottom line is communication so that some middle ground can be reached. In order for that to happen, parents and professionals cannot make assumptions, or the partnership will dissolve. "If everyone comes to the table with their own agenda – therapy, school, providers – that can be difficult to overcome." Donene has found that advocating for children is one of the most rewarding experiences she has had.

Rachael Cocozza of New Jersey successfully advocated for her son Adam, 8, who has autism. She had assistance from Adam's grandmother, who is an educator at a special school. Rachael's dilemma was finding an appropriate school program. She researched the best programs and found there were none in her school district that would meet Adam's needs. Adam started in a preschool program that was only two and a half hours per day. Rachel threatened to go to Due Process for an appropriate placement.

Rights under IDEA

The Individuals with Disabilities Education Act (IDEA) is a federal law. Some of the key components state that all children are entitled to a "free appropriate public education." This includes special education and related services (such as, but not limited to speech, physical and occupational therapy) provided at public expense. Education must be done in the "least restrictive environment"; "Children with disabilities are educated with children who are not disabled and special classes, separate schooling, or other removal of children with disabilities from the regular educational environment occurs only when the nature or severity of the disability of a child is such that education in regular classes with the use of supplementary aids and services cannot be achieved satisfactorily."

Under the Due Process clause of the Fourteenth Amendment, states may not deprive any person of life, liberty, or property without due process of law. Protected property rights are created by such sources as state statutes granting persons certain benefits. The Supreme Court has held that students have a property interest in education that required minimal Due Process protections.

Threats alone can be counterproductive, but if parents have exhausted all other avenues without success, when threats are made parents must be prepared to follow through. In Rachel's case, rather than face a lawsuit, the school immediately gave her options. Adam was able to attend the Search Day School in New Jersey that uses an intervention called "pivotal response." The original goal was to bring Adam back into district for kindergarten. Rachael was able to arrange a split between the preschool program and the special program, resulting in a full day for Adam. At age six, Adam attended half-day kindergarten. Since then Adam has been attending public school for first and second grade. His program involves team teaching in an "inclusion" class with a special education teacher. These days, Adam doesn't even need an aide.

Ruth Moore of Oklahoma advocated for her own children and then became an advocate for others. Between them, her children—Melissa, Dean, Robert, D'Monique and Phoebie – have a range of neurological and psychological disabilities. Ruth usually had positive dealings with her school district, with the exception of one principal who made it difficult to obtain services. One of her daughters was hospitalized for seven months but now, with appropriate supports, she is able to split her day between regular and special education classes. Another child's challenging behaviors were addressed with support from the law enforcement community through a violence prevention program along with an individualized curriculum, a reduced school day, and a summer employment program to help with social skills.

Ruth encountered problems with the school system, however, when it came to her son Dean. She felt Dean was not being given the services he needed and requested that his progress in school be evaluated before his next IEP was written. Until the evaluation was completed, she requested an interim plan under Section 504 of the Americans with Disabilities Act (ADA) which was the first federal law to prohibit discrimination based on disability.

But Dean's school did not implement the 504 plan and Dean began to fail in school. When the principal put the IEP process on hold as a last resort, Ruth referred her to the federal IDEA law and hired a paralegal to write a complaint letter to the state's Department of Education. The school quickly decided they should begin the evaluation. Ruth is currently undergoing mediation with the district, but in the meantime they are following the 504 recommendations and Dean's academic progress has improved.

Finding the Way

The parental instinct to protect a child is kicked into high gear when that child has special needs. Parents find themselves grappling with the educational, medical and legal systems in a struggle to provide a full and rewarding life in spite of a child's disabilities.

It is easy to lose heart when the systems that are expected to provide direction and assistance become antagonists in a battle for dignity and human rights. But by banding together and reaching out to the community of others who have traveled the way before them, some parents, enlisting the aid of trained, experienced experts such as attorneys or advocates, find an enriched sense of meaning and a way to turn those struggles into strategies for success. And, depending on each family's circumstances, success will mean different things to each of them. However, each family needs to know that all along the continuum from total inclusion to residential placement, if it makes sense for their child and their family, it is the right way to go. **EP**

Lauren is also the NJ Caregiver Community Action Network representative for the National Family Caregivers Association and was recently appointed by the governor to serve on the State Interagency Coordinating Council.

familiar faces

STEVEN

Steven Matthew Carreno, 2, and sister **Katelyn**, 11 months., have a special bond. Steven was born with the umbilical chord wrapped around his neck, which resulted in severe brain damage. He has Cerebral palsy, seizures, cortical blindness and a feeding tube. He enjoys music, bright lights, cuddling and being adored by Katelyn!

JULIA

Pictured are **Julia Murphy**, 16, and her sister **Erin**, 12, who has Rett syndrome (a rare neurological disorder). In this snapshot the girls are enjoying patriotic holiday decorations at a local plaza. Erin attends the Carusi Middle School in Cherry Hill, NJ,where she participates in seventh grade activities.

MICHAEL

Michael Arechavala, 3, loves playing with his brother, Kevin, 9, and sister, Michelle, 5. Michael has Down syndrome, and attends a fully inclusive preschool all week where he receives OT, PT and speech therapy. He enjoys going to the playground, eating ice cream and hanging out at the beach.

NATALIE

From the moment that **Chip** (right) met **Natalie Aurelio**, 11, he knew that she was someone special. No matter who she meets, instant bonds of friendship and support are created that bring joy to Natalie's life and to the lives of those around her. Natalie is fighting a rare, degenerative brain disorder called Batten disease. She lives with her parents Liz and Dave, her 13-year-old brother Nicholas and her canine pal, Chip.

AMANDA

Amanda M. Van Aken, 9, has a smile a mile wide. Amanda has Cerebral palsy, is non-verbal, communicates with a communication board and has recently learned how to walk on her own! She enjoys listening to music, swimming and going to school. Amanda lives with her mom Laura Naccarato in Brooklyn, NY, and loves to play with her best friend in the world, Sandra Lane.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (Exceptional Parent), 65 E. Route 4, River Edge, NJ 07661. (Please do not send originals or "one-of-a-kinds" as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

Exceptional Parent Magazine

Welcome Resources Technology Edu/Toys Healthcare Subscribe

eparent.com

New! Visit the EP Web site, EParent.com, and discover…

TOYS—The new eToys Web site (www.etoys.com) teams with EP's Web site, EParent.com (www.eparent.com) to offer ideas, information and imaginative toys for families with kids who have special needs. When parents, teachers or caregivers shop at eToys and visit the co-branded EParent.com site, they'll find hand picked toys and games, plus featured articles from EP Magazine. The site also features direct links to the EParent.com shop at eToys, and eToys products recommended by experts or reviewed by organizations chosen by EP Magazine.

EDUCATION—EParent.com's newly-constructed Education channel (EDU/TOYS tab) yields a wealth of current articles on topics such as IDEA, IEPs, assistive technology, transitioning and inclusion. These are supplemented by a growing directory of schools, camps & residences, which can be found in the "Directories" link of the "Resources" channel.

ON-LINE ARCHIVES—Now, EParent.com users can preform keyword searches through our on-line archives and purchase articles which have appeared, as far back as in the eighties, in EP Magazine (recipient of awards from Folio:The Magazine for Magazine Management, Easter Seals, Consumer Healthcare Group). These include classic pieces on such subjects as early childhood, rare disorders, technology, education, medical research update, transitioning, travel, all of which have distinguished EP Magazine through the years

MORE TO COME IN 2002—You can also click through our EP Library (www.eplibrary.com) which contains books, videos and software encompassing almost 50 specific and general categories, with more than 650 titles. Of course, we will continue to refresh and improve EParent.com in 2002, and look forward to receiving your comments and suggestions. Log on and find out what we are all about!

SHOE-TYING MADE SIMPLE!

Shoe-tying Made Simple is a tutorial aid developed to assist children with disabilities learning how to tie their shoes. The kit includes color-coded laces, a full color standup instruction manual and instructions for both left and right-handed children. Each step is presented in 3 different ways. Full-color pictures are provided for the visual learner, a rhyming story helps the auditory learner and tactile kinesthetic cues assist the hands-on learner.

Junction of Occupational Therapy Function, 447 Ibis Way, Naples, FL 34110, 941-777-4009,
E-mail: Kelly@junctionof-ot-function.com, URL Web Site: http://www.junctionof-ot-function.com

SNAKEY®

SNAKEY® is a plush puppet designed to assist children with disabilities in the development of fine motor skills. It's seven detachable color-coded segments each joined by a different type of fastener, providing children with the skills to use buttons, snaps, clips, zippers, plastic buckles and Velcro®. SNAKEY® is over five feet long and machine washable.

PERISCOPE PANEL

The Periscope Panel is a wheelchair accessible playground activity panel. This height adjustable panel is constructed from three-quarter inch thick high-density, U.V., stabilized, colorfast polyethylene material called Permalene®. The periscope can rotate from side to side and tilt forward thirty degrees. It is equipped with an octagonal tube containing stainless steel mirrors and accommodates children from two to twelve years of age.

Lets Have Fun
An Exercise Program For People With Special Disabilities

LETS HAVE FUN

Lets Have Fun is an exercise video program designed for people with disabilities. It starts with a warm up that stretches all muscles and increases heart rate. An aerobic segment features low-impact exercises with visuals to help stimulate the imagination, while a cool down helps to increase flexibility and return the heart rate to normal. The Lets Have Fun video exercise program also includes a free style dance segment to increase motivation.

Announcing A Special Offer From EP Press

Patient Persistence

Adele M. Gill

ON SALE NOW!

This book celebrates the ability of people to overcome obstacles to achieve their goals. The author, Adele Gill, is a certified disability analyst, a Fellow of the American Board of Disability Analysts, and an advocate of inspirational and motivational self-help. Ms. Gill has divided the book into two sections, Hope and Courage. Both contain selections that deal with turning points in people's lives, times when they found strength, hope, and the courage to persevere in the face of adversity. This book offers help and hope to those who feel that their lives are out of control or that things have gotten so bad that there will never be a way to make them better. Through examples from the lives of real people, this volume demonstrates that there is always a way.

No Apologies for Ritalin

Vidya Bhushan Gupta, MD

ORDER NOW & SAVE!

This book takes an in-depth look at attention deficit disorder/attention deficit hyperactivity disorder (ADD/ ADHD). Vidya Bhushan Gupta, MD, MPH, a Board-certified pediatrician and a Fellow of the American Academy of Pediatrics, is Director of Developmental-Behavior Pediatrics at Metropolitan Hospital Center, New York City. In his book, Dr. Gupta eloquently educates parents of children with ADD/ADHD about the disorder and available treatments, so that they can make informed choices for the care of their children. The first portion of the book describes what is medically known about ADD/ADHD, including causes and diagnostic methods; the second part outlines available treatment options, including Ritalin and other drugs, dietary changes, herbal therapy, and behavior modification. Dr. Gupta's purpose is to help parents of children with ADD/ADHD to stop blaming themselves for their child's disorder and to investigate and use appropriate therapies, including Ritalin and other medications when indicated, without guilt.

Code # EP8012AD Price ~~$19.95~~ **Sale $16.95**

These books are published by EP Press, the book publishing division of Exceptional Parent magazine, the country's oldest and most widely read publication for families of children and adults with disabilities and special health care needs and the physicians, allied health care professionals and special education teachers involved in their care and development. **For a limited time these books can be ordered at this special price by calling EP Library at 800-535-1910, or through their web site at www.eplibrary.com. Danny

by Rich Psillos

Danny doesn't cry. After all of the hardships he has been dealt, he doesn't complain. He doesn't sit there and ask why. He goes on with a smile like it is the best day ever.

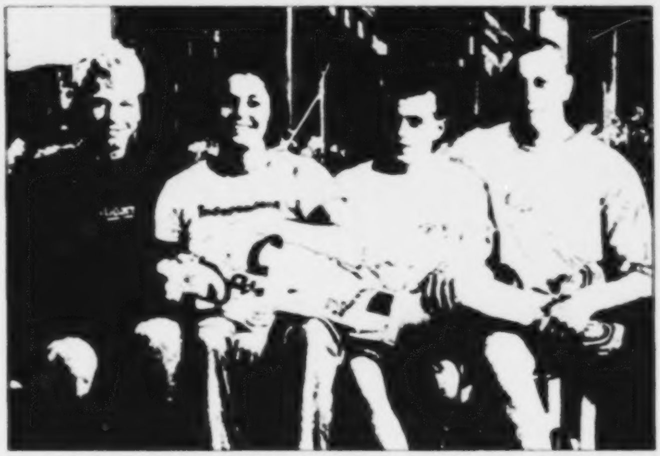
He is my little brother. He doesn't say more than a few words and can't understand much but he is the best thing that ever happened to me. He has helped me to realize how important life is and not to ruin it. Could you imagine not being able to tie your shoes or walk into the kitchen and grab something to eat? I couldn't. But since he has never had these luxuries, he doesn't realize what he is missing.

Every day when he wakes up, he is so excited to see my family. I wonder why? How could he be happy with all of his problems? When I wake up, all I say is, "Oh man, another day of school," not realizing that it is a blessing to be able to receive an education. I feel badly; I take my body and mind for granted sometimes.

I've also learned to be very affectionate, always caring and watching out for him. He's my brother and friend. I'm thankful he entered my life, changing me in so many ways. EP

My Brother

by Jessica Psillos



The Summer of 2001 brought everyone together for a picture. From Left to Right are Rich (17), Jessica (19), Charlie (13) and Joshua (16) Pictured Lying down is Daniel (8)

Everything will pass. Sometimes things happen and you think that they will last forever. But time passes and things change.

One of the biggest parts of my life is my youngest brother. He's severely handicapped. He's seven now and doesn't speak or walk on his own. I never knew that having a handicapped sibling would change my whole life, but it has. Every day is different because of him–our lives have a different way. Now that I have experienced life with him, I wouldn't want to change our situation. At times it is difficult, very difficult, but it's worth it.

MOM'S TURN

Kathy Psillos, mother of Rich and Jessica, writes:

Richie and Jessica wrote these articles while in their senior year of high school. I thought that parents of special needs kids might enjoy hearing about the positive effects of disabilities. I know it would have helped me in the beginning of our journey. Daniel has been a blessing in our home.

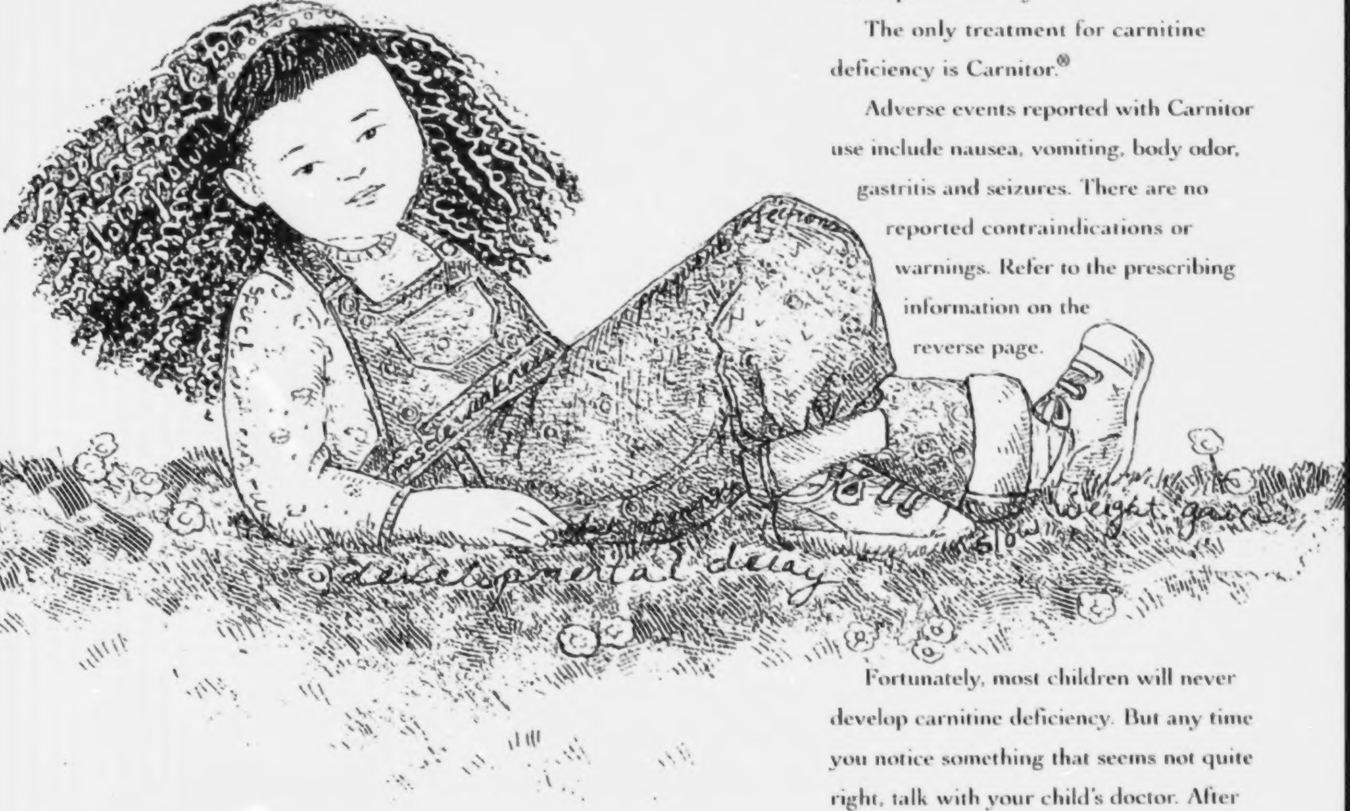
CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?



No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.

Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor® levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

©2000 Sigma-Tau Pharmaceuticals, Inc. All rights reserved. PA-10

Circle #55 or visit www.eparent.com/adinfo

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occuring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that binaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 μmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

Publisher's Letter

Parenthood is for many of us the most rewarding, yet most challenging aspect of our lives. For parents of a "special child," this is particularly true.

Parenting a special needs child requires special commitments. Sometimes, these commitments become overwhelming, even daunting. That is why The Center for Discovery has underwritten an unrestricted grant to EP for the purpose of exploring the very real emotional issues and difficult decisions parents/families have to address in order to meet the lifelong needs of their child.

EP has been proud to research and publish this four-part series whose mission, coincidentally is four-fold: to educate parents about what resources are available to them; to expand awareness as well as horizons about alternatives; to empower parents to make informed decisions without guilt or regret and to engender action. We call these the Four Essential Elements of Family Centered Care. The third segment of this four part educational series appears in this month's issue and all four parts are available on our website www.eparent.com. Through the chronicling of real-life families and helping them evaluate the emotional, financial and overall considerations that affect everyone involved, The Center for Discovery and EP hope to help parents make informed choices on behalf of their children.

As we all know, the special education service delivery system comes in many sizes from full inclusion to residential placement. Providing guidance to recognize the nature of the "right size" services to meet each individual child's needs is what this educational series is all about. Equally as important, the series provides needed practical advice and emotional support with respect to how parents and caregivers can obtain those targeted services.

The series also tries to help parents discern the quality of programs. We must always remember that it is the responsibility of any good education program to change and adapt to the needs of the individual so as to effectively move the child forward. It is not the child's responsibility to "fit" into what is being offered.

As you read the articles included in this series, you may have thoughts or suggestions. We welcome them and hope you write or email us at http://www.edit.eparent.com. These articles are part of an ongoing effort by EP in the special needs area to insure the efficient use of all available resources for the purpose of helping the single greatest treasure we have as a nation and as a people... our children!

Sincerely,

Joseph M Valenzano

The Heart of a Lion, The Eye of an Eagle and The Wisdom to Gift Them

ILLUSTRATION BY MS. MEMORY COLLINS

I love my organs. Sure, with some of them it's more like a love-hate relationship, but I greet them enthusiastically every morning.

Readers of EP know all too much about organs. In fact sometimes I think a better title for this monthly would be EO, Exceptional Organs. Because organs, the way they don't always develop, function, and play nicely with each other, are the soul of this magazine. Readers of EP magazine live and breathe for and because of organs that march to the sound of a different drummer.

In fact, every day, sixteen people die waiting for an organ transplant. There are more than 80,000 people on waiting lists for life-saving critical organs. Hundreds of thousands more would benefit from a life-enhancing tissue replacement, such as skin or cornea transplants. Every year these numbers increase. Every year the number of people willing to donate organs when they die decreases.

I'm not writing to continue clearing the way for persons with disabilities to receive organ and tissue transplants; that frontier has pretty much been fortified. I'm writing to introduce the notion that individuals with developmental disabilities and their families have the right, obligation and wisdom to participate in the national call for people to consider being organ donors.

First, it is a legal right of all citizens to donate their organs and tissues. The Uniform Anatomical Gift Act specifically recognizes this right. All organ donors are evaluated on an individual basis. There is no inherent reason why citizens with developmental disabilities would be unsuitable candidates for organ donation. The only exceptions are those candidates who have extracerebral malignancies or unresolved transmissible infections, such as AIDS or hepatitis B.

When Dr. Chris Prater, my colleague at Orange Grove, and I made inquiries about the possible genetic contraindications to people with developmental disabilities making organ donations (and we communicated with genetics researchers, organ procurement specialists, transplant surgeons and immunologists), no one knew of any. This demonstrates another aspect of the non-personhood status of our population.

There are many reasons why physicians have not been more effective in the arena of organ procurement. Focus groups of doctors have concluded that the barriers to physician involvement include:

- lack of time to discuss organ donation with family;
- tensions between physicians and organ procurement organization staff;
- fear of perceived or actual conflicts of interest;
- unwillingness to address the issue in nonurgent settings;
- inadequate knowledge of regulations and protocols;
- discomfort with the subject; and
- lack of training in recognizing medical futility.

Add the above to the physician's lack of comfort and appreciation for the Exceptional Parent, and the chances of having a physician approach the family of a child with special needs about organ donation are slim.

So once again it's up to you, the parents. You've changed doorway dimensions, laws, funding exemptions and attitudes, and you can change this. I'm proud to say that my colleagues, in concert with the parents at Orange Grove, are starting to explore the various ways in which this issue can be addressed.

It is the purpose of this editorial to advocate and endorse the consideration of organ and tissue donation as part of the life plan of a person with developmental disabilities. It's not about giving back; it's not about perpetuating souls, spirits or legacies. It's about announcing to the world that people with disabilities have something to give, because all along they've had something to share. All along they've shared needs, hopes, dreams—and organs. EP

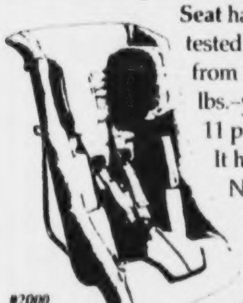
Johnny, 51 lbs. and 48" tall, in the Columbia Car Seat

Sharing the Caring

Columbia offers you solutions to the daily challenges of transporting, bathing and toileting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

☐ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! It has been the No. 1 choice since 1986, for its adjustability and stylish comfort.



#2000 Car Seat

■ At bathtime, our popular **Reclining Chairs** and **Wrap-Around Bath Supports** allow your child – and you – to enjoy the bath.

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

#7700 Hi-Back Wrap-Around Support

■ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

Why do these products work so well? Columbia products are thoughtfully designed, with each item available in the **right size for your child,** with lots of adjustability for a custom fit. They are made of durable materials, tested and proven in real-life experience. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

#4200 Small Support for children

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

Search & Respond

S

Sleep Problems

My 17-yr-old son has Klinefelter syndrome, VATER syndrome, Horner's syndrome, and brain damage from a lack of oxygen at birth. He developed a seizure disorder two years ago and after many allergic reactions to standard drug therapies was placed on Keppra and Ativan. He has also developed a sleep disorder, always staying awake for more than 24 hours, and often only falling asleep after experiencing a seizure. He can become quite combative, hitting himself and others. He is also on Zantac (post anastomosis for esophageal atresia) for GERD and Valium for sleep (which does not get him to sleep but helps a bit with the combativeness). Has anyone else had these problems with these medications?

– JS, 935, via EP Web Site

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to eped-it@aol.com; or visit Search & Respond on our web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

EDITOR: Although not a panacea, melatonin (a natural hormone in the body that induces sleep) can be taken orally and sometimes helps people with brain injury or other cognitive or emotional disabilities to sleep better.

S

Combative Sleeping

I am the foster mother to a young man with Down syndrome. He has also been diagnosed with Tourette syndrome. He has a particular behavior that I am very concerned about. When he is asleep at night he will begin to pound his head with his fist over and over, never varying from the same spot on his head. When I tap him to turn over (I can hear it all the way from my room), he immediately repositions himself and the hitting stops. It will then continue off and on during the night. He has had an EEG (for seizures) which showed negative results. If you've ever heard of this or have any suggestions, I would really like to hear from you.

– SB, 937, via EP Web Site

S

Vomiting as a Self-Stimulation Behavior

I am a consulting teacher for special education programs. Two students, in different schools, are vomiting at both school and home, apparently as self-stimulation. One student puts his finger down his throat and vomits, while the other usually gags and then spits up. This week, however, he gagged until he vomited. In both cases, the doctor has ruled out biological causes of the behavior. Any help with how to stop this particular type of self-stimulation would be greatly appreciated.

S

Looking for Support

I am desperately looking for a link to a web site or a chat room for parents of children with disabilities or special needs. I just need a place that I can go from time to time to speak with others who are in a similar situation. Sometimes the stress makes me feel I am alone, which I know is not true. My son Cody is 7 and he was born with severe hydrocephalus, and brain damage that has left him with CP. He uses no speech (just screaming), experiences seizures, has low muscle tone, vision problems and is wheelchair-dependent. Just looking for others that are going through the same challenges to chat with from time to time. Thanks!

S

Down Syndrome Menstruation

I have an 8-year-old daughter with Down syndrome. I am searching for anyone who can give me information on what to expect when my daughter begins menstruation. I have heard very little other than that medication is given to stop the cycles in some cases (but I don't think it was related to DS). She will be 9 in December and I know this may be a bit early, but I feel I need to start exploring options now. If anyone can

I want to make sure he's cared for all his life.

I'm Sarah, 43.
My son Jeremy has overcome many obstacles.
Financial insecurity shouldn't be one of them.

MetDESK

My husband Bob and I want to make sure Jeremy is provided for when we're not around any more. So we talked to MetLife. Their MetDESK (Division of Estate Planning for Special Kids) specialists helped us with the many financial and legal issues in providing quality lifetime care for Jeremy. Since many of the MetDESK specialists are parents of children with special needs, they're knowledgeable and understand families like mine.

For more information on MetDESK call 1-877-MetDESK (1-877-638-3375). Ask for our brochure *Planning for Your Child with Special Needs* or visit our web site at www.metlife.com/desk.

please help or share their experience with me it would be of great help.

– DD, 958, via EP Web Site

EDITOR: The onset of menstruation for young women with Down syndrome, although a challenge, is not necessarily a problem that requires medical management. Lots of teaching and loving support may be all that's needed. Sometimes, however, personal hygiene care proves to be just too difficult. In such cases, the menstrual cycle, which typically occurs monthly, can be modified to occur only once every 3 or 4 months by using one of the oral contraceptive pill formulations, in a modified dose, with the guidance of a doctor.

Chewing Clothing

My son had brain damage when he was born due to an intrauterine infection. One of the effects is that he chews whatever fabric he can get his hands on. The only way we have been able to deal with this is to keep chewable fabric out of his reach. He wears a windbreaker jacket most of the time. The material, being tougher, is therefore more difficult to chew through. He does eventually chew through it, but it's a lot less expensive to replace one jacket every few months than a shirt a day. Also, he uses an unzipped sleeping bag for a comforter because it is made from thicker fabric. We tried putting him on Zoloft, an anti-depressant also used for obsessive compulsive behaviors. His chewing did not change and now he refuses to eat anything that isn't mush! Please let me know if anyone has suggestions to improve this situation.

– MG, via EP Web Site

Respond

VNS Concern

KD has a 7-yr. old daughter who is developmentally delayed, has a seizure disorder, and doesn't talk. The doctors have given the ok for her to have the Vagus Nerve Stimulator Procedure, and she is curious about other experiences with VNS.

My daughter had VNS installed in September 1998 and has responded very well. We were able to decrease from four medications to one for almost a year. I would recommend VNS when other brain surgery or use of a ketogenic diet is not an option, as with my daughter. So glad we did the VNS.

– JT, 1296, via EP Web Site

Alternative AFOs

My son wears AFO's and we have found that Teva sandals work if you extend the straps. This is easily done using velcro strips (found in any fabric shop). 1) Take a strip of the "soft" part (where the velcro teeth attach to) and place it over the "hard" part of the Teva strap, leaving a few inches to extend beyond the strap. 2) Place the "hard" part over the soft part, again leaving a few inches to extend beyond the soft part. 3) Attach the "hard" part of the velcro to the Teva sandal. Hope this helps.

Solutions for Wet Nights

Bed Bath and Beyond sells a plastic "bag" to protect mattresses. It works very well. You may want to try it on the comforter too. Also, we put an extra diaper on our son at night that goes horizontally over his stomach, which we tape to his regular diaper. It provides an extra couple of inches of absorption above the regular diaper and it makes a big difference.

College for Those with LD

V has a 16-year-old son with a learning disability who is looking for information on appropriate colleges to attend.

There are many colleges that are just starting to include accommodations for student's with LD and ADHD. It is important to check out the program, talk to other LD students who also attend that college, and get statistics of graduates with LD. My stepdaughter is currently 24 years old and has both LD and ADHD. She attended Rainy River Community College for two years and did not earn her AA degree there because she did not pass some courses. Augsburg College in Minneapolis, MN accepted her, and she began her work there. She earned her AA degree by transferring classes. She graduated with her BA this May after six years at Augsburg. She has attended classes every summer to retake classes she has had problems with in a lighter course load. At Augsburg, students have LD specialists and are able to get the help they need. I also have a nephew who has LD and ADHD. He is 18 years old and a senior in high school. He is choosing to attend Hennepin Technical College in Eden Prairie, MN. This technical college offers LD support and a specialist to help him as well. Do not shut out the idea that learning a trade may be an option your child may want to pursue. The one thing to remember is that your child is an adult. This is a time when parents must step back and let the student be their own advocate.

Quality for life

The Bugsy walker's maximum adjustability and solid, lightweight construction provide safety, convenience, and functionality like no other.

The Bugsy's highly adjustable design encourages active postural control during standing and walking, while also promoting a more natural movement. Unlike other walkers, Bugsy's solid rubber wheels feature stainless steel ball bearings for smooth, easy maneuverability. The anti-reverse wheel design prevents inadvertent backward rolling for safety. Lightweight construction and a quick fold-up feature provide easy handling and storing.

Contact your Otto Bock Sales Representative (U.S. 1-800-328-4058 or Canada 1-800-665-3327) to see the Bugsy pediatric postural walker firsthand.

Instant S&R

School Yard Harassment

My 14-year-old son has mild to moderate mental retardation, a speech difficulty and learning disabilities. He has been in special ed classes since he was three years old, and now attends a middle school where his special ed class is a separate entity from the main school. His previous educational experiences were in environments where non-disabled children became "buddies" with the special ed kids, i.e., had reading time together, were partners at assembly, etc. Now, in middle school, there is no such interaction and my son is being cruelly taunted, called "loser," etc. and will walk all the way around a building to avoid contact with his tormentors. I know these kids just don't know any better, or are afraid of the differences between themselves and special ed kids. I was hoping someone out there could give me some help on what to do for my son to heal his very sensitive feelings and give him some encouraging/coping skills, as I know this will not be the last situation in which he faces people who don't understand. I also wanted to know of any way I can get the school to integrate rather than ostracize, to help these kids understand and have some empathy and compassion for each other. Thanks for any and all help.

– 598, via EP Web Site

Have you ever informed the school of what's going on? Your son has the right to be safe in school, both physically safe and emotionally safe. Check with your state's attorney general and see if there are any hate laws on the books. Also, the US Deptartment of Education sent a letter to all state departments of education on the need to protect kids in special ed from abusive situations. This includes verbal abuse. Also, find out what the school's policy is on racial slurs. If they have a zero tolerance for harassment on the basis of race and gender, but "look the other way" when it comes to disability harassment, then they are violating the Americans with Disabilities Act (Title 2) and Section 504 of the 1973 Rehabilitation Act. Schools MUST comply with both laws (even though many will try to tell you they don't have to). Don't let this slide. Your child has the right to go to school without fear. Plus, by seeing your response, your son will learn that it is possible to stand up for your rights, a lesson he will need later. Good luck,

– CJ via EP Web Site

We have a person we call a Tracker. This person makes sure that the child gets from one place to another without being harmed (either mentally or physically). The trackers also help in the different classrooms, so children can be integrated with the "normal" students. The trackers make sure that the work is done to the ability of the students, and inform parents with daily notes to help the parent see what the child is accomplishing. With the right person and training this can be very helpful in putting our children in regular schools and preventing their seclusion from society. Everyone has the right to be treated as a regular person despite our differences!

– SN via EP Web Site

HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

The Stockton features full crib safety sides

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

Fenway Park, Historic Venue

The Boston Red Sox and Exceptional Parent Magazine will be hosting the first Disability Awareness Night at Fenway Park in Boston on August 20th, 2002.

In cooperation with the United Cerebral Palsy Foundation, Easter Seals and the Tourette Syndrome Foundation, Exceptional Parent Magazine and the Boston Red Sox want to call attention to Americans with disabilities.

In a pre-game ceremony at home plate, State Senator Fred Berry of Mass. will be honored for his outstanding

Timmy Stevens (pictured above with Red Sox shortstop Nomar Garciaparra) and his mom Ellen work to give back to both the Professional Center for Child Development (PCCD) and the Children's Hospital in Boston, MA. Timmy, who is ten years old, has cerebral palsy, seizure disorders, cortical vision impairment and osteopenia. He and Ellen have helped to raise money for Timmy's school and the hospital by participating in fundraisers and charity events.

This mother-and-son team first got involved eight years ago, through a road race for the PCCD called Trot for Special Tots. This event has become tradition for the Stevens family, with either Ellen or another family member pushing Timmy's chair in the race each year. For the past two years, Timmy has also been a "patient partner" with the Kids at Heart program. The program matches kids with runners in the Boston Marathon who race to raise money for

for August Disabilities Night

the Children's Hospital.

Last year, Timmy was one of three children to represent the hospital at the CIBC World Miracle Day, an annual event that benefits many different children's charities. Every year, many of the trading staff at CIBC donate the commissions they generate on "Miracle Day" to children's charities across the country and around the world.

Ellen says that being involved in these events has been a wonderful and exciting experience for her and her son. They have met many other families, as well as some interesting celebrities such as former Bruins player Cam Neely.

Timmy (left) and Ellen Stevens with cousins Tommy and Jimmy at the PCCD Trot for Tots.

While this kind of involvement has been great for the Stevens family, Ellen says that parents should not feel obligated to give back in this way. "Only if they have the time and energy," she says. "The most important thing is to keep your child healthy."

dedication to people with disabilities. He will be presented with the Maxwell J. Schleifer Distinguished Service Award. Maxwell J. Schleifer was one of three co-founders of Exceptional Parent magazine 31 years ago.

The event will be similar to the one held at Yankee Stadium on July 3, which honored US Marine Corps Commandant James L. Jones and his wife Diane, as well as Bill Porter, the star salesperson who overcame childhood disabilities.

The New York Yankees and the Boston Red Sox have been the first teams to "step up to the plate" for disability awareness. They have done numerous things in their respective communities to help people with disabilities.

Exceptional Parent is developing additional events to promote disability awareness. The Atlanta Falcons will be holding an awareness day this fall at Turner Field in Atlanta. EP

Healthy Start

Good Nutrition for Babies with Special Needs

By Christine Wood, MD,
author of "How to Get Kids to Eat Great and Love It!"

As a pediatrician, I know first hand how concerned parents can be about their child's health. Parents of infants with certain medical conditions should stay attuned to their child's growth patterns and physical development, as these are the prime indicators of disease-related health problems during infancy.

The most important step any parent can make in encouraging proper development is to visit a pediatrician to gauge a child's health and development. This is done largely through measurements of the child's growth curve, a ratio of weight gain to length (height). Head circumference measurements are also important to track in the first three years of life. Infants with special conditions may have growth curves that vary from the norm. Consult a pediatrician to determine if your baby is growing normally, as variations do occur.

Children with a flat growth curve—those who are not gaining adequate weight and are falling significantly in percentiles—have failure to thrive (FTT). Some children with developmental and genetic conditions are at risk for FTT. A pediatrician or a dietitian who is well acquainted with infants with special needs may be able to suggest ways to make sure the baby is receiving proper calories and nutrients.

Feeding your child with special needs

Parents should discuss any feeding problems with their pediatrician to determine if there are community resources to help manage feeding and nutrition. These resources are usually found through a local children's hospital, where they are familiar with special health needs.

While it is important for a baby to gain weight, it is equally important to maintain a healthy and varied diet with all of the right nutrients. Breastfeeding is the most perfect source of nutrition for all babies, especially those with special needs. Breast milk provides antibodies to fight disease and infection, and strengthens the bond between mother and child. Breastfeeding is important for children with neurological disorders and babies born with Down syndrome, cleft lip or palate, cardiac problems and cystic fibrosis. There are a few rare metabolic diseases (galactosemia is one) where infants cannot receive breast milk. Babies with these diseases cannot break down certain components in the breast milk and can become ill. For infants who have trouble gaining weight, a pediatrician or pediatric dietitian might recommend using fortifiers that can be added to the breast milk to ensure adequate weight gain.

A mother may have difficulties breastfeeding her baby with special needs. However, most of the time, counseling by a certified lactation consultant and some patience will achieve the goal. Mothers can also benefit from some of the products available for expressing and feeding breast milk. Some problems often associated with breastfeeding include:

- Difficulty with swallowing, associated with such neurological disorders

890

as cerebral palsy, trauma to the mouth, congenital abnormalities, or disorders with motility or movement of the upper gastrointestinal tract.

- A mother may need to offer extra kinds of physical support while nursing a child with too much or too little muscle tone.
- Infants with some diseases, like cystic fibrosis or phenylketonuria (PKU), may require special formula supplements.

The nutrient may also show promise in lowering cholesterol and heart disease risks, improving asthma and eczema, and in treatment of depression, migraines and ADD.

With some types of problems, consultation with a certified lactation consultant, pediatric occupational therapist, pediatric physical therapist and pediatric specialist related to the child's disease, may all be indicated to support the needs of baby. Special feeding devices and techniques may also be needed for these infants.

One nutrient that is particularly important in both infancy and beyond is docosahexaenoic acid (DHA), an omega-3 long chain polyunsaturated fatty acid. This fat is one of the important building blocks of the brain. During pregnancy and breastfeeding, the baby accumulates this fat from the mother and incorporates large amounts into the brain and eye tissue. This nutrient has recently been made available in infant baby formulas and the Beech-Nut First Advantage line of baby foods.

The role of omega-3 fats has been studied in a broad spectrum of diseases. DHA has been linked with lowering the risk of autoimmune diseases like multiple sclerosis, rheumatoid arthritis and diabetes. The nutrient may also show promise in lowering cholesterol and heart disease risks, improving asthma and eczema, and in treatment of depression, migraines and ADD. Of course, with any of these processes, omega-3 fats are not the complete or only answer, and should be considered along with conventional treatments under the direction of a physician.

FEEDING TIPS

Here are some feeding tips to support nutritious weight gain for infants with special needs. [Keep in mind: A pediatrician, pediatric specialist or dietitian should always be consulted first before making any dietary changes. Consult with a pediatric occupational or physical therapist for special feeding problems related to motor or physical handicaps.]

–Ask your pediatrician about infant formulas that provide more than the regular 20 calories/ounce, or some of the new formulas with DHA

–Ask your pediatrician about human milk fortifiers for babies not gaining adequately with breast milk

–Feed your child baby foods with DHA after the baby is on second-stage solid foods

–For babies over 12 months of age, instead of milk, offer Pediasure, which has more calories

–Add calorie-dense foods like avocados to solid foods

Other nutrients that are vital during infancy include vitamin A, vitamin C, folic acid, potassium and dietary fiber. These nutrients are found in various fruits and vegetables. The American Dietetic Association recommends setting a goal of five servings of fruits and vegetables a day. Following are some foods that provide these nutrients. These foods can be found in most commercial baby food lines.

Vitamin A: apricots, cantaloupe, mangos, carrots, dark leafy greens, sweet potatoes

Vitamin C: cantaloupe, oranges, strawberries, broccoli, potatoes, peas, tomatoes

Folate: strawberries, oranges, avocados, broccoli, dark leafy greens, peas

Dietary fiber: applesauce, mangos, pears, carrots, green beans, corn

Potassium: prunes, dark leafy greens, bananas, potatoes. ■

Christine Wood, M.D. has been a practicing pediatrician since 1982 and is currently in private practice with El Camino Pediatrics. She attained her undergraduate degree from the University of Detroit and her medical degree from the University of Michigan. She completed her pediatric residency at Children's Hospital of Los Angeles and received her lactation educator certification from the University of California, San Diego.

While Studley (left) helps her balance, Karolline (right) picks the colors she will use for her mural. This easy exercise helps Karolline strengthen her leg and wrist muscles.

The Just Right Challenge

By Megan Henninger

The solutions to alleviating some childhood movement problems and sensitivities are often common activities incorporated into everyday play. That is the core of The Just Right Challenge, which uses both exercise and parents to help children. The concept, originally developed for early intervention, has been integrated into physical therapy by Kelly Studley. Studley, who has her MS in physical therapy from Arcadia University in Philadelphia, PA, is a pediatric physical therapist at University Hospital in Newark, NJ, where she sees patients in the neonatal intensive care unit, the early intervention program, both the in-patient and out-patient programs and in the high-risk nursery.

Parents should first consult a pediatrician when considering physical therapy. Many therapists will not evaluate a child without a doctor's prescription due to legal and insurance restrictions. When going to a pediatrician or a therapist, it helps if parents have considered some of the following questions:

- What is the child doing?
- What does the child need to do at their age?
- Why aren't they doing it? (Is it a coordination issue? A strength issue?)

Studley asks parents to consider several factors when deciding if physical therapy is needed. She says that once a child has reached the ages of 3-5 years, it is important to watch how they fine-tune their behavior. If they're walking, parents should note what the child's gait looks like. Another factor to consider is if the child walks up on their toes. She wants them to observe if the child is stepping through with both legs and/or dragging one foot a little behind the other.

Sensory reactions can also be observed in this manner, she adds. Visually, children can have aversions to light or objects flying at their face, or have trouble focusing on a single point. Similar problems can occur with auditory stimuli.

Studley says that one such example presented itself in a group therapy session where she noticed a normally calm little boy continually flinching. After watching the boy she noticed that his response directly coincided with the symbol crashes of another child playing in the corner. Further investigation revealed that he was sensitive to loud noises. With careful introduction of music and gentle rhythms, his sensitivity improved. However, as Studley reminds, "It wasn't necessarily because of us; I think his mom's just really working with him at home." As in many other success stories, parental involvement was key to facing the challenge.

These details seem minute, but they benefit therapists and parents alike. For instance, Studley described one young girl who could get on a bicycle, get her feet on the pedals and pedal to her heart's content. However, if there was nothing holding her feet to the pedals, they came right off. She could not quite grasp the details involved in bike riding. Clips or straps that might keep her foot in place were suggested, as well as pedaling bare-foot so that the girl could get a better feel of having the pedals under her feet.

Studley explains that during the first visit it helps therapists to learn a lot about the family. What parents are seeing, their daily routine and their goals for the child are all key to creating the "just right" challenge. Because parents are just as involved as children, Studley believes that the goal should be something the parents can understand and work toward. In Studley's view, "that's what pediatric therapy is all about: it's training the parents to be the experts, because they already are the experts."

For example, a parental goal could be similar to "My child will be able to sit up to play with a toy." For a professional, this might read, "This child will demonstrate postural stability in order to demonstrate writing reactions when placed in a sitting position for bimanual play." Though they mean the same thing, parents will work on the first and ponder the second.

A good way of honing parental expertise is by learning about the system being used to evaluate your child. Knowing what a therapist is looking for may give parents an idea of what to look for in their child when determining if they are progressing or what further help needs to be provided.

Karolline works the tricycle to build her leg muscles while Studley verifies that mom understands how to help Karolline try this at home.

One of these assessment tools is H.E.L.P (Hawaii Early Learning Profile). According to Studley, it's quite popular, especially in early intervention programs, because it looks at all six areas of development. This is one of only many systems a therapist could be using, so consulting the therapist before researching assessment tools is a good idea.

"If you're making them go in some direction they don't want to go, you're going to lose them."

Studley says that certain things, such as toys and siblings, can get in the way of therapy occurring at home or in session. However, she adds that there are ways to turn them into assistants. For example, a favorite toy can be used to accomplish many tasks. A child developing balance could have to walk on a balance beam to get to the objects for play, or the toy could be put at the end of a hallway for a child to ride down on a tricycle in order to build leg strength.

Siblings can also be advantageous if they are willing to cooperate. Many children may be afraid of a new activity. Studley says that if an older brother or sister can model the exercise, showing the child that it isn't harmful, the child may find that the challenge is just right for them. Siblings can also participate in activities such as throwing , catching or providing an extra set of hands for balance activities. As long as the sibling is willing to help, inclusion can be a great asset to therapy.

Studley recalls only one thing that parents have done to try to help her that has actually been a hindrance. Sometimes a child will misbehave and this can cause a bump in the parent/therapist relationship. During such instances, therapists hope parents will take cues from them. Each therapist has a different point where they will say "enough is enough" and ask the parent to intervene on their behalf. However, the therapist needs his or her own chance to control the situation.

Studley remembers certain instances where she wasn't ready to hand over control to the parents, but they interrupted to discipline their child. She acknowledges that, "a lot of times parents are just trying to step in and be extra helpful or overly helpful because they care so much about their kid." But this can also cause problems. If the child believes that the therapist has no control over the session, the therapist could be left with a rampant child as soon as parents turn their backs.

Studley acknowledges that it is difficult for parents to watch their children struggle, but adds that therapists often feel the same way. The child has to meet their own challenges, however, through their own work and persistence. "You just have to keep reminding parents that because their child is working so much harder than a typically developing child to do this, any kind of effort that they put into the task is a great thing," Studley says. "So, even if they're not doing exactly what we want them to do, if they're trying to get there that's still a movement in the right direction, so we still need to say, 'That's a good job!'"

Studley also advises professionals to be aware of when they're pushing children too hard. "If you're making them go in some direction they don't want to go, you're going to lose them," reminds Studley. With sessions that can last anywhere from 30-60 minutes, it is difficult to keep children interested.

Studley explains that by letting the child lead the session, it can be done. "If they start to whimper they can go see mom, have some juice, have a cracker,

continued on page 28

continued from page 27

or we'll just do something that backs off a lot. Because you don't really want to push them over the edge to the point where they're like, 'this is too hard. I don't wanna do this.' Because the next time I walk into the room, I become the crazy lady who forces them to do things." The challenge has to be just right for the child in terms of both difficulty and duration.

Therapy is not a quick solution, but it can be a fun challenge. Through purposeful play everyone can be included and no one child has to face the climb alone. The "Just Right Challenge" describes more than simply finding the right activity to strengthen a child's muscles. It reflects the supporting family and friends who help to achieve it, doing what they can to make it "just right."

Karolline takes a break while Studley labels her pictures in both English and Portugese.

"IF PLAY WERE GOING TO FIX A CHILD, THEN THE CHILD WOULD BE ABLE TO FIX THEMSELVES"

This is one of the key themes that Studley offers parents. However, the solutions to possible problems are often common activities incorporated into everyday play. The following are some suggestions that should not only be fun for your child but also help them build basic skills:

SKILL: SITTING UP

What parents can do: "Consider ways of getting the child into a sitting position where they are reaching forward for the toy," says Studley. This both amuses the child (because of the toy) and makes it easier for them, as it is easier to keep one's balance while leaning forward. While the child is leaning forward, sit behind them such that your legs help support them. Gently move the toy to one side or another, so that should the child fall, they fall into a parent's leg. Repetition of this will help a child understand that there is a limit to where their balance needs to be. They can then learn their boundaries and how to come back up from that position.

SKILL: CRAWLING

What parents can do: Crawling may be a problem if a child does not have enough strength in their arms to carry their own weight. By getting a parental arm underneath the child to help support them, the weight their arms and legs have to bear decreases. Often, this makes the challenge "just right" for them, allows them to get onto all fours, strengthen their arms and legs and learn how to crawl.

SKILL: STRETCHING

What parents can do: Stretching is probably one of the most important therapy techniques as it gently reminds muscles how they work. Bath time can be a great opportunity to laugh and play with a child while stretching their legs a couple of times. Or practice kicking and stretching their legs while watching a children's video. Mornings are also a good time, as getting children dressed provides the opportunity to give a few tugs on arms or legs to stretch the muscles out a bit.

SKILL: USING BOTH SIDES OF BODY

What parents can do: "You can restrict their one side," reminds Kelly. By restricting the side used most and putting objects on the neglected side, the child is encouraged to use this otherwise dormant side. However, a child may resist, believing that it's too difficult. Sometimes, with help from mom, dad or the therapist (similar to a gentle lift at the shoulder or elbow) the exercise becomes easy enough that the child is willing to try it. This is an integral part of the "Just Right Challenge."

SKILL: ABDOMINAL MUSCLE STRENGTH

What parents can do: If the child is older than one year, lay the child on their back, with their head on a safe, padded pillow during play time. Then the game begins. Playfully offer the child the toy, so that they have to begin to sit up to get it. After they begin reaching, gently push them back onto the pillow with a playful, "Don't come get that toy." The child will normally giggle and try for the toy again. After a few repetitions of the activity, give the child the toy so that they can enjoy and relax.

Discover the faces of Children's Hospital

Everyday we take special care of children. From broken bones to long-term care, from infants to teens. It's our understanding of children and their families that makes us unique.

For over 80 years now, Richmond's Children's Hospital has been providing specialty pediatric care. We understand children. And what it takes to tailor our services to their individual needs.

Take for example, our Pediatric Feeding Disorders Program, one of only a few such services in the country.

Or our Inpatient Rehabilitation Program which helps children who have experienced trauma, disease or impairments return to the activities of daily life.

For adolescents who need subacute care to babies who have never seen the outside world, our Transitional Care Unit is a step toward home. And a place where parents learn to care for their child's special needs.

Discover where children come first.

Infant Development Specialists

PLAYING WITH BABIES, HELPING THEM GROW

By Linda S. Dingman, MA

It's Wednesday morning and my first stop is the gated community where two-year-old Susannah lives with her mom and dad. Susannah has a developmental delay, yet despite numerous blood tests and genetic studies she does not yet have a diagnosis. Next I will head downtown to work with 8-month-old Margarita, an adorable baby with Down syndrome. She lives in a tiny, one-bedroom apartment with her mother, grandmother and three brothers. Afterwards I will see handsome Zachary, who was exposed to drugs before birth. He was placed in a wonderful foster home directly from the hospital. Late in the afternoon I will visit the twins, Charlie and Andrew. The boys were born prematurely, and Charlie developed severe hypertonia. At 18 months old, he is unable to sit up. Andrew seems to be reaching developmental milestones on schedule but joins our play sessions because he is a valuable assistant and co-teacher.

WHAT IS AN INFANT DEVELOPMENT SPECIALIST?

Infant development specialists are special education teachers who work in early intervention, also called infant stimulation, usually in the client's home or occasionally in day care. They incorporate play skills and basic motor skills into their lessons and stimulate both receptive and expressive language. Some specialists work with counselors and other professionals in regional centers.

> ***If the family agrees to infant stimulation, the counselor calls me to make the referral. In some cases, the baby will receive many types of intervention, making me part of a team including an occupational therapist, physical therapist, speech therapist and, in a few cases, a behavior management specialist.***

An infant development specialist must meet specific state standards. I hold a state credential in special education for the severely handicapped and am self-employed, but some infant development specialists work through agencies that have both in-home and center-based programs, such as early intervention preschools.

HOW ARE CHILDREN REFERRED TO ME?

Children may be referred to a regional center for specialists by their pediatrician or another professional who is concerned about their development. Usually an occupational therapist and a regional center counselor visit a child's home to evaluate the baby. They use assessment tools in their evaluation, such as the Bayley Scales of Infant Development II and the

Receptive-Expressive Language Scales, and also make clinical observations of muscle tone and range of motion. If the family agrees to infant stimulation, the counselor calls me to make the referral. In some cases, the baby will receive many types of intervention, making me part of a team that includes an occupational therapist, physical therapist, speech therapist and, in a few cases, a behavior management specialist.

TRACKING THE CHILD'S PROGRESS

In order to track progress, I must observe the baby's skills as we play and gather information from the parents. After a few weeks, I write an initial report which incorporates the birth and medical history and provides a portrait of the child's personality, likes and dislikes, needs and abilities. I continue to work with the child once or twice a week, taking notes to track the newest achievements and any changes in health or living conditions. After four to six months I am required to write a progress report either requesting an extension of my authorization to work with the child or recommending that s/he make the transition to an appropriate preschool program. In some cases, the child does not go to a program outside of the home, either because s/he is not ready or because it is not what the parents wish. No matter what, I only stay with the child until age three, after which the family must find another form of support. Some children who were originally considered to be at risk for developmental delays will have caught up and no longer qualify for help. Others will qualify for special education in public school; I am usually involved in helping the family make that decision.

WHAT HAPPENS DURING A PLAY SESSION?

Upon arriving at a client's home, I sit on the floor with the child. Each week I bring a different selection of toys and other objects. My toy bag designed for babies holds rattles, simple cause-and-effect toys with lights and music, and a collection of interesting textures such as silk, pot scrubbers, velvet and a sponge. Some weeks I bring jars of good things to smell, such as garlic, oregano, cloves, cinnamon, eucalyptus and perfume. The toddler bag has shape-sorters, simple puzzles, blocks, nesting cups and role-playing toys such as cars and trucks or dress-up clothes and a tea set. In each bag I include colorful board books and a ball. I start each play hour with a "Hello" song and end with blowing bubbles. To facilitate language development, I use sign language whenever possible. Some activities are seasonal: at Halloween we carve pumpkins; at Christmas time we make a simple gift for the family; at Easter we dye a hard-boiled egg; and in the summer we do a lesson about fish and seashells. Whenever possible, I bring along an age-appropriate art activity. If the child is upset, I sing lots of songs. Young children learn best with multi sensory, language-rich activities paced to suit their temperament and age.

HOW DO I WORK WITH THE FAMILIES?

Many of my clients treat me as a part of the family. Although I am a professional and try to maintain objectivity, by sitting on the living room floor twice a week for a year or more I get to know the cat's name, welcome the new baby, and help translate those mysterious governmental forms that come in the mail. Susannah's grandmother lives on the east coast, so her mom often asks me for practical advice. Margarita's family doesn't own a refrigerator, but her medicine must be refrigerated, so I am working to link the family with a local church that sells good used appliances at very low cost. I enjoy locating resources for families and have developed an extensive list of local agencies, publications and web sites that are useful.

OPTIMAL LEARNING ENVIRONMENTS

Parents often want to stay with the child while I work. I welcome their involvement and can offer suggestions for successful learning activities. On the other hand, in Charlie and Andrew's home the hour that I play with the boys is a necessary break for mom. It may be the only chance she has to fold the laundry, start dinner or collect her thoughts.

continued on page 32

My toy bag designed for babies holds rattles, simple cause-and-effect toys with lights and music, and a collection of interesting textures such as silk, pot scrubbers, velvet and a sponge.

When a family feels that they are the head of a team and can work in concert with the regional center and all the specialists in their child's life, the results are often amazing.

continued from page 31

Although brothers and sisters are welcome to participate in my lessons, occasionally a jealous or unhappy sibling makes learning impossible. Sometimes I can bring along a special toy that will appeal to the older child so that everyone benefits.

SOMETIMES IT DOESN'T WORK OUT

A family sometimes decides after a few sessions that they do not want infant stimulation for their baby. Although their expressed dissatisfaction can help me grow as a teacher, I worry about the child. Occasionally the parents focus their grief and anger over having a child with delays on me. In other cases, there are very serious problems in the home, and the family does not want an outsider in their lives at that point. The parents' wishes are always respected, and counselors work with the family to find the services that will best fit their needs.

TEAMWORK AND RESULTS

Parents know more about their children than anyone else does. When a family feels that they are the head of a team and can work in concert with the regional center and all the specialists in their child's life, the results are often amazing. Some children reach milestones in sudden spurts. Others acquire new skills slowly but surely. Some of my clients have seemingly made no progress at all until they undergo surgery or a change is made in medication. Once they are truly well—often for the first time in their lives—they make splendid strides.

SAYING GOODBYE

Next month, Zachary will be given his diploma. When I met him, he was a cranky baby who was months behind schedule. Now, he is an engaging little boy, and everyone's favorite. Although I will miss him, I already have other clients waiting for me to fit them into my schedule. EP

Justin Dart, Jr.
Legend in Disabilities Advocacy

Best known as the father of the Americans with Disabilities Act (ADA), Justin Dart, Jr. recently passed away at age 71.

Dart was a great supporter of people with disabilities in America and around the world, and worked for more than fifty years to improve awareness and relevant legislation. He is credited with having a significant role in enacting the ADA which was signed into law by President Bush in 1990.

Born in Chicago in 1930, Dart's advocacy began shortly after he contracted polio at age 18 and became wheelchair-dependent. Passionate about civil rights for many groups, he organized an "integration club" at the University of Houston and continued to support rights for women, gays, lesbians and people of all races throughout his career.

Dart was also an entrepreneur, and founded three successful corporations. One of them, Japan Tupperware, Ltd., grew from four employees to 25,000 within the first two years of its existence. Dart used his corporate ability to support his political beliefs by employing women and people with disabilities when others would not.

The list of awards that Dart has received over the years is pages long. Some of the more notable include:

- ☐ Induction into the Disability Hall of Fame (1987)
- ☐ The World Congress of Rehabilitation
- ☐ International, President's Award (1992)
- ☐ The National Parent Network on Disabilities, Outstanding Leadership Award (1994)
- ☐ The National Council on Independent Living, for outstanding contributions to civil rights (1996)

In 1998 President Clinton awarded Dart the Medal of Freedom, the country's highest civilian honor. Dart has also served numerous government appointments, including Chairperson of the President's Committee on the Employment of People with Disabilities.

Dart was known for his cowboy hat and boots, as well as for his tenacity and relentlessness. He has visited every state in the country at least five times, mainly to promote the passage and implementation of the ADA. He has often been compared to Martin Luther King, Jr. because of his leadership and commitment to civil rights.

Dart is survived by his wife, Yoshiko, and five daughters.

Shopping solo

Chase, a 19-year-old with autism, can now tolerate the noise and overhead music in the store. He's learned to ignore the candy and chips, to choose nutritious foods without the help of props or pictures. Back at Heartspring, he neatly puts the groceries away and sets the table. After dinner he washes and dries the dishes. With only a little supervision. And with a lot of pride.

Universal Newborn Screening AN UPDATE

By Julia Steele

While universal newborn screening has obvious benefits where health and disease prevention are concerned, the implementation of such programs comes with a certain price tag attached. The question in this case is the same as in most others when it comes to governmental issues: who is going to pay for it?

Newborn screening is a process by which certain disorders can be tested for and potentially identified in the first 24-48 hours after birth. It is not a new concept; the first screening test was developed by Dr. Robert Guthrie at the University of Buffalo in 1961. Just five years later, his test for phenylketonuria (PKU) had been adopted on a mandatory basis by every state and the District of Columbia. Other newborn screening programs have fallen into place as well. For instance, universal hearing screening is supported by the American Academy of Pediatrics (AAP) and the Maternal and Child Health Bureau of HRSA (Department of Health and Human Services).

Now, although we still do not have the ability to screen for every existing metabolic disorder, there are at least 30 disorders that can be identified. This has been made possible largely by the development of a technology called tandem mass spectrometry (MS/MS). While it cannot screen for all metabolic problems, MS/MS is very effective in identifying fatty acid, amino acid and organic acid disorders.

It is up to each state to set its own regulations about which tests to mandate or make available on a supplemental basis. Only a few tests have been universally adopted. All 50 states and the District of Columbia screen newborns for PKU and congenital hypothyroidism; 49 states screen for galactosemia; and 42 states screen for sickle cell anemia. Beyond that, there is quite a disparity among states; some require only three tests while others require more than twenty, and not every test is available in every state (see the charts on pages 36-37).

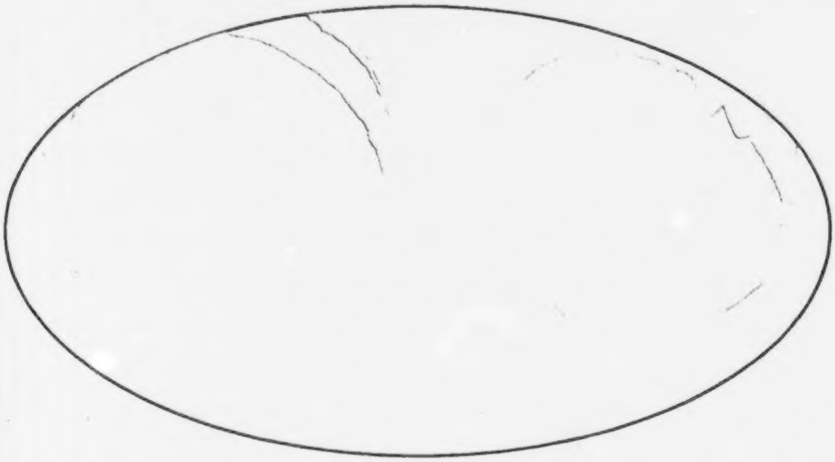
Many states are in the process of independently increasing their newborn screening programs, since new technology is making testing easier and more economical. At least 15 states have become interested in MS/MS technology and have implemented pilot projects to determine what kinds of screening programs are most worthwhile. In states where MS/MS is not used, parents can order test kits from private labs to be sent back for MS/MS screening. Still, there are many people who believe that universal newborn screening should be mandated; that is to say, that every test should be available in every state.

This is much more easily said than done, however, because each state also determines what, if any, fee to charge for screening. Some states choose to bill parents directly, while others pay for testing with tax dollars or other funds. This is one reason why some states have such limited screening programs.

In many cases where parents are billed, their insurance companies will cover the cost. Some states even require that health insurance plans cover newborn screening fees in their state (e.g., Arkansas, California, Missouri, Texas). But no matter where the money comes from, one thing is clear: In order to establish any kind of universal program, there must be a way to pay for it.

Many variables determine the cost of screening. For example, some hospitals use state or regional labs to run the tests, while others send samples away to private labs. Also, there are different costs for each type of test, so total screening cost can vary depending on which tests are performed. In March 2001, PricewaterhouseCoopers conducted a survey on newborn screening showing that the average cost of processing specimens for the 28 states responding was $18 (the median was $15). In cases where states do not cover this cost themselves, screening fees tend to be inflated in order to help cover overhead costs.

The development of MS/MS has helped to reduce the price of newborn screening, since it can test for nearly 30 different disorders all at once, including conditions such as PKU, maple



syrup urine disease, and biotinidase. The processing only takes about two minutes, though it does take longer to read the results. This means that the system can process large numbers of specimens, which would be necessary for universal screening. But because it cannot screen for all disorders, some tests still have to be run separately, keeping the cost up.

Another issue involved in cost analysis is the return of false positives. Typically, the screening process will return either a "normal" or an "abnormal" result. An abnormal test does not mean that the disorder is definitely present, just that follow-up testing is required. Again, MS/MS is improving the screening process, reducing the rate of false positives seen with traditional methods from about 1.5 percent to about 0.26 percent.

Of course, follow-up testing means an additional financial cost. And since many of these disorders can present themselves rapidly after birth, even within hours, it is imperative that follow-up testing be done as soon as possible. Before a given state can expand its screening program to include more tests, it must ensure that it has adequate follow-up procedures available for the tests it already provides.

Many of the diseases for which newborns can be screened are actually quite rare. In the majority of abnormal returns, further testing reveals that there is actually nothing wrong. Still, the cost of universal screening is negligible compared to the cost of leaving these disorders undetected. Many of the conditions screened for can result in severe mental retardation or even death if left untreated. You can't put a price on the life of your child.

It is important to remember, however, that there is more to handling a disorder than simply screening for it. None of these disorders is preventable, though all are treatable. Once a metabolic disorder is identified in a newborn, that child will likely need medication and a special diet to control the condition, sometimes for the rest of the child's life. These treatments can be very expensive.

The costs associated with universal newborn screening may not all be economic, either. There are emotional and societal issues to consider as well. For instance, not all parents prefer to know ahead of time that their child will develop an incurable condition. There are also the emotional costs that come with false positive test results. And while newborn screening is able to detect many metabolic problems early on, a normal test result does not guarantee that problems won't develop in the future.

Answers to these problems may be provided if screening programs are carefully developed. If parents prefer not to know the outcome of their child's test, give them the option not to read the results. To curb the anxiety that comes with an abnormal return, let healthcare providers properly educate expectant parents about the screening process, including the tendency of abnormal results to be misleading. Also, provide parents with literature about some of these disorders and signals they can watch for, should something develop in the future.

Universal newborn screening is an important issue that is getting a lot of attention. MS/MS and other advances have made such a program much more feasible in recent years, but the need for specialized training and the great expense of the machines are still hurdles to be overcome before universal screening is a reality. It may just be a matter of time while technology continues to improve and provide more affordable testing methods. In the meantime, it is important for parents and physicians to make each other aware of the issues, and to weigh the costs involved. EP

For more information on universal newborn screening, see EP's earlier articles on universal newborn screening in Aug., Sept. and Oct. '00, which are reprinted in our monograph, "Universal Newborn Screening." Other articles appeared in Aug. and Sept. '01. Archived articles can be found at http://www.eparent.com

Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002

LOCATION:
Orange County Convention Center—Orlando, Florida

***A UNIQUE GATHERING*—**A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract **physicians • families • direct support professionals • people with disabilities • allied health care professionals • educators • adapted physical education specialists.**

TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more, hosted by America's Athletes with Disabilities.

EMPLOYMENT SYMPOSIUM AND PAVILION: Human resource managers will discuss career opportunities, sponsored by Florida's Agency for Workforce Innovation and the Florida Department of Education, Division of Vocational Rehabilitation Services (VRS) and McDonald's Corporation.

ASSISTIVE TECHNOLOGY LEARNING CENTER: Produced by FAAST. Computer Stations designed for hands-on education and fun.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.

CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation, through approved accreditation institutions, will be offered for a dozen disciplines.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with Florida's Agency for Workforce Innovation and the VRS will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

WORLD CONGRESS & EXPOSITION ON DISABILITIES
WCD

October 3-5, 2002 • WORLD CONGRESS & EXPOSITION ON DISABILITIES

EXCITING NEW FEATURES TO HIGHLIGHT WCD IN OCTOBER!

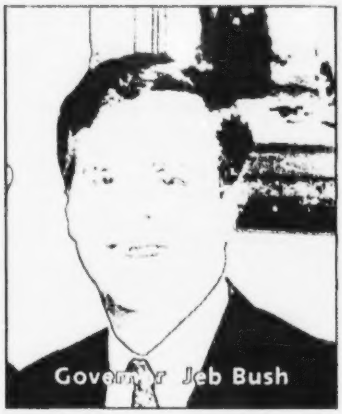
The World Congress & Exposition on Disabilities (WCD) is fast approaching. Coming October 3-5, 2002 to the Orange County Convention Center, this event has matured into an event which producer H.A. Bruno, LLC and all the sponsors and supporters can be proud of. The WCD is sponsored in association with EP (Exceptional Parent) Magazine, and Sigma Tau Pharmaceuticals as a gold sponsor. Over 40 national and local organizations, along with 11 publications, support and promote the event throughout the year.

The conference program, developed by the EP Foundation for Education, Inc., is sponsored by UPMC Health System, University of Pittsburgh School of Medicine Center for Continuing Education in the Health Sciences, and supported by EP (Exceptional Parent) Magazine and the National Institute of Health's Office of Rare Diseases. The program has expanded to over 200 sessions including many sessions for people with disabilities and their families, medical professionals, educators and many others. Included this year are over 60 adapted physical activity sessions and more than 50 topics specific to employment for people with disabilities.

The exhibit floor of the WCD will have more product and service providers than ever before. "Companies that exhibited with us previously are back again, and through word of mouth over the last two years many more new exhibitors are participating," said Director of Sales Rich DelGiorno.

In addition to the increase in educational seminars and the exhibit floor, numerous special features will be offered at this year's show in our new location, Orlando, Florida.

SCHEDULED SPECIAL GUEST SPEAKER, GOVERNOR JEB BUSH



Governor Jeb Bush

On Friday, October 4th at 5:30 p.m., Governor Jeb Bush will take time out of his very busy schedule to present a keynote address at the WCD. Governor Bush earned a bachelor's degree in Latin American Affairs from the University of Texas at Austin. He came to Florida from Texas in 1980 as a businessman with a small family and big dreams of opportunity. He later served as Florida's Secretary of Commerce where he ardently promoted Florida's business climate worldwide. Following an unsuccessful bid in 1994 for governor of Florida, Bush founded a think tank, the Foundation for Florida's Future and helped launch the state's first charter school in Liberty City.

Governor Bush was elected the 43rd governor of the state of Florida on November 3, 1998. During his first three years in office, Governor Bush and his administration have honored their commitments to the people of Florida to improve public schools; provide substantial, broad-based tax relief; fight the battle against illegal drugs; protect the natural environment; get tough on criminals who use guns; and reform social services to better serve children, elders and those with disabilities.

DENTAL, VISION AND SPEECH-LANGUAGE SCREENINGS

Nova Southeastern University's College of Dental Medicine and College of Optometry faculty and students will conduct complementary dental and vision screenings, while the Fischler Graduate School of Education will provide screenings for speech-language and communication disorders. And all right on the exhibit floor.

CONTINUING EDUCATION CREDITS

UPMC HEALTH SYSTEM

CME and CEU accreditation is being offered through the University of Pittsburgh School of Medicine. CEU accreditation has been awarded for nurses (12 hrs), athletic trainers (16 hrs), speech-language pathologists (1.2 hrs), social workers (16 hrs) and OB/GYNS (10 cognate hrs). CEUs for OTs, PTs, recreational therapists and family practitioners are pending. CEU accreditation for educators (1.3 hours) is available through the Council for Exceptional Children. The conference program is developed by the EP Foundation for Education, Inc., a 501(C)3 not-for-profit organization, with the assistance of EP (Exceptional Parent) Magazine. (For accreditation updates, please call 877-923-3976 x 852.)

WEDNESDAY WORKSHOPS

Even though the exhibits and conference program begin on Thursday, October 3, three adapted activity workshops have been scheduled for Wednesday, October 2. "Physical Fun for Everyone," addressing modifications and instructional ideas for children's activities, and "The Top Down Planning Model," which will focus on the implementation of Individualized Education Program goals and objectives for physical education, will take place in the afternoon. The evening session, "The Circle of Rings—Collaboration between Teachers, Therapists and Families," will be a lively panel discussion on family issues related to adapted physical activity. All sessions are participatory and attendees should come dressed accordingly.

EMPLOYMENT SYMPOSIUM AND PAVILION

Florida's Agency for Workforce Innovation and the Florida Department of Education, Division of Vocational Rehabilitation Services are sponsoring a 55 session Employment Symposium for those seeking employment as well as potential employers, and an Employment Pavilion, with dozens of companies looking to hire individuals with disabilities, sponsored by McDonald's Corporation.

we love to see you smile

ELECTION DAY

It is important that every American eligible to vote take advantage of the opportunity. So get out and make your vote count. However, you can not vote if you are not registered. Voter registration will take place at the WCD. This opportunity comes around but once every four years. Be Heard.

WHEELCHAIR SERVICE AND REPAIR

Custom Mobility will offer up their expertise for emergency service to manual and power wheelchairs to keep them mechanically safe, including flat tires, tightening wheels, wheel locks, etc. This service is free of charge to all WCD attendees. "We are looking forward to sponsoring a service center at this year's World Congress and Exposition on Disabilities. We will be available for emergency service throughout the event. If you have any questions about the servicing and maintenance of your wheelchair we will be glad to discuss this with you," said Customer Service Manager Robert Kriebel.

We are Stardust, We are Golden

Reflections on an international conference on practice and professionalism

by Marianne Taylor

In June 2002, direct support professionals (DSPs) and their advocates from around the world gathered in the college town of New Paltz, NY for three days of celebration and learning. Hosted by the Mid-Hudson Coalition for the Development of Direct Care Practice and the State University of New York at New Paltz, the conference was called Common Threads. Conference participants shared the excitement that comes from being part of something very special and contributed to the synergy that occurs when great people and creative ideas come together.

The conference had a theme song, also named "Common Threads." The title suggests that like a familiar flannel comforter, human services support needs no explanation across cultures; it is global in its purpose of serving humanity. Throughout the world it is a fabric that weaves together the threads of comfort, education, hope and healing that comprise the universal language of direct support.

As the parent of a child who is struggling to move beyond the obstacles of his disability to make friends and be successful in the world, it is impossible for me to imagine how he and our family could face this often-difficult journey without the assistance of competent supporters. At the conference I traded war stories with a dad whose early experi-

---

RESPITE-A CONSUMER'S PERSPECTIVE

Dani & Gene Feierstein

Respite: Time away from disabled family members, usually paid for by an agency other than the parents. The purpose is to give caregivers time away from some of their responsibilities and, it is hoped, reduce their stress level. While respite can be a great relief for a stressed-out parent, it is ultimately the parent's responsibility to make it work.

Respite services are generally not well publicized, so parents will have to seek them out. Contact your local mental health agency as a start. Once you have found a source, you will have to select a respite worker. Unless you are employing someone you already know well as a respite provider, talk with candidates before leaving your child in their care. Get references and check them, just as you would for a day care provider. Ask about the type of training and experience they have and where they got it. Is their CPR certification current? How recent is their first-aid training?

After you have talked to them all, ask yourself if you want to hire any of them. Did each one listen and ask pertinent questions? Did each one seem interested in working with your child? This is a job interview; don't be afraid to follow your instincts. If you decide to hire someone to care for your child, negotiate a mutually acceptable price for their services or research the set rate in your area.

Be very clear about what you expect from your respite worker. Is s/he allowed to bring children or anyone else along? Agree upon rules for the use of telephones and other household appliances. Some areas allow respite providers to transport clients in their own cars. If you are comfortable with this, make sure that the car is insured and in good shape. Decide who pays for the gas. Don't forget to leave a car seat or a booster seat if your child needs one.

You have a right to find your house the way you left it. This does not mean that the respite provider is also supposed to clean the house. I also appreciate it when telephone messages are written down.

Discipline is another issue that needs to be thoroughly discussed. Explain why and how you discipline your child and that you expect the respite provider to enforce the rules accordingly. No respite worker should physically punish a child.

Make it clear that calling in to see how things are going does not mean you don't trust the provider. When you return, expect to be told what happened in your absence.

ences in bringing up his beloved but hell-raising (his description) son were remarkably similar to mine; we laughed and wished each other well. Knowing fully that our futures and the futures of many others are highly dependent on qualified direct support staff, we were both at the conference to work for a better future for us, for our loved ones with disabilities and for direct support professionals.

DSPs touch deeply the lives of the people they support. The character of this touch is shaped when the raw materials of commitment, creativity and concern are cultivated to their greatest potential and effectiveness by a combination of theory, guided practice and an ethical framework. Conversely, we endanger and devalue those who rely on direct support and betray the spirit of human service work when we fail to invest in the preparation and recognition of DSPs.

That is, in its valuing of each person regardless of disability, vulnerability or life condition, direct support provides a profoundly transformative and radical response in a world that some would argue is moving toward the extremes of materialism and behavior devoid of social concern.

This was the situation in South Africa before Nelson Mandela was elected, explained keynote speaker Lesley DuToit, the former special advisor to the Minister of Welfare in the Mandela government. DuToit described the horrors of a national social service system that had institutionalized—warehoused—most at-risk children, neglecting them and providing no support. Mandela, DuToit and others reformed this system through a philosophy of the native American Lakhota tribe. Called the Circle of Courage, it promotes a focus on the characteristics of generosity, mastery, independence and belonging. DuToit described how workers helped transform the lives of children in this system by using these guiding principles and the strategy of focusing on one child at a time. What a remarkable opportunity to make a difference in the lives of South African youth!

continued on page 44

If it helps, create a checklist of things to discuss with the provider. When we went away for a weekend, I left written instructions about meal times, menus, snacks, bed and nap times. Because my son likes his routine, I wrote down things like his favorite blankets, stories and other little things. Remember: you know the routine that works for your child; your provider doesn't.

Your provider has a right to any information that has to do with caring for your child. Outline what your child likes and dislikes and explain how you deal with difficult situations. If your child understands, explain what is happening so that the respite worker does not have to deal with a surprised child when the parents leave.

Your respite worker has a right to expect things from you, too. I always give providers a binder containing all the information they might need. You must take the time to explain such things as the timing and dosage for medication and whether or not it should be taken with food. Let providers know if a reaction can be expected. Dietary requirements should also be described in detail.

Remember to leave a current medical release form with the respite worker. Some hospitals and doctor's offices will let you leave one on file with them. Leave doctors' names, addresses and phone numbers and all health insurance information, including the child's Social Security number. I also post emergency information on the refrigerator. If I am going away for the weekend, I leave menus, schedules, emergency contact information and money for food and bus fare.

A respite provider has the right to expect your home or apartment to be in acceptable condition, with a functioning telephone. Tell your provider if you have pets. Some people are afraid of animals or are allergic to them. If this is the case, secure the pets where the caregiver won't have to deal with them.

Let your neighbors, friends or someone you trust know when you are going away, when you will return, and who will be in the house taking care of the children. Leave telephone numbers of neighbors or friends as a precaution. This does not mean that they will check up on the respite provider, just that they will be aware that you are away. It is another way of making sure that everything is O.K.

It is sometimes hard to gauge children's reaction to respite. You need to ask them questions when you return. If your child is non-verbal, it might be more difficult. Ask for feedback from the respite worker too. Find out what worked for them - and what didn't.

Dani and Gene Feirstein have been consumers of respite services in both California and Virginia, where Dani also served as a respite provider. They have a 22-year-old son with a congenital genetic disorder.

THE CENTER FOR CHILDREN • HOSPITAL FOR JOINT DISEASES

Caring for children with
Cerebral Palsy
requires the help of many specialists.

Now you can find them all at
one special place.

The Center for Children is the one place you'll find all the care options you need, with just one concern in mind: your child. By bringing together the resources of the Hospital for Joint Diseases (HJD) and the Rusk Institute of Rehabilitation Medicine (RIRM) of NYU Hospitals Center, we can care for a variety of conditions in one convenient setting. For example, you'll find the widest possible range of treatments for children with cerebral palsy, with in-house specialties including pediatric physiatry, orthopaedics, speech therapy, neurology, neurosurgery, physical and occupational therapy. All in a gentle, kid-friendly environment where there are no white coats, but plenty of color, interaction, toys, games and stimulation. From newborns to 21-year-olds, The Center for Children treats them better. **Call us at 212-598-2330.**

continued from page 43

At a session presented by the National Alliance for Direct Support Professionals (NADSP), a voluntary, national coalition that advocates for improving the conditions of direct support work in the United States, members invited workshop participants to describe the meaning that they find in their work. Many people at this session, and throughout the conference, described human service work as a gift of the spirit, noting how much they receive from the people they support and how great it feels to make a difference in someone's life. One woman told a story of the joy she felt when, after six months of teaching one man the use of a napkin at meals, he used a humorous and pointed non-verbal gesture while they shared a meal, showing that not only had he learned how to use a napkin but he thought that she should use hers.

As speaker Martin Brokenleg explained, in the Lakhota culture generosity becomes a springboard for healing and renewal; the act of giving away what is dearest is painful but liberating, permitting the giver to start over. Several people talked about human services work as an opportunity to live in the grace and generous spirit that is fundamental to the religions of the world: treating others as you would like to be treated. How many jobs provide this opportunity?

Harold Jacobs, a professor in the sociology department of SUNY-New Paltz, described it in this way: "Direct support demonstrates the humanized vision of a future that is not yet fully manifest." That is, in its valuing of each person regardless of disability, vulnerability or life condition, direct support provides a profoundly transformative and radical response in a world that some would argue is moving toward the extremes of materialism and behavior devoid of social concern. This does not mean, however, that DSPs must take a vow of poverty, earning less than a living wage. Jacobs went on to say that social justice demands a salary commensurate with the complexity and responsibilities of direct support.

In its working session linked to the conference, the NADSP continued efforts on a series of statements that will call for better working conditions for direct support professionals. Called the Moving Mountains NADSP Workforce Development Principles, they represent a call to human services systems, employers and organizations to align our actions with our rhetoric by shaping better workforce conditions for DSPs.

We also asked people to tell us what should be done to make human services a viable career choice. Their answers are the "common threads" that NADSP members hear from their peers across the country: recognition in all its forms, having a voice in decisions, having a professional image and the credentials to back it up and earning an income that is sufficient to maintain a family. These are the common threads that weave together our agenda for a stronger direct support workforce as we work to:

- Enhance the image of the role and the field of human service;
- Provide access to high-quality education and training;
- Change the system to assure a stable, competent workforce;
- Support the partnership of people with disabilities and support practitioners; and
- Promote the development of career paths.

We must find ways to jump-start the extensive transformations needed to create high-quality direct support over the long term. The Common Threads conference provided inspiration and a forum for these important discussions. EP

Marianne Taylor is the Senior Project Director at the Human Services Institute, an NADSP (National Alliance for Direct Support Professionals) co-chair and mother of a son with special needs.

Lifespan Respite Bill Introduced to Congress

On May 9, 2002 Senators Hillary Clinton of New York, Olympia Snowe of Maine, Barbara Mikulski of Maryland and John Breaux of Louisiana introduced The Lifespan Respite Bill, S2489, to Congress. If passed, the bill mandates the implementation of and funding for "coordinated systems of accessible, community-based care services for all caregivers of individuals regardless of the individual's age, race, ethnicity or special needs." These programs would be available to parents, family members, (including grandparents), foster parents and certain other adults who care for people with special needs. The bill calls for $90.5 million fy 2003, and increasing to $200 million fy 2007. These funds would be disbursed on a competitive grant basis to states and certain localities, depending on their likelihood of improving statewide respite care. At present, no federal programs exist to handle this type of care.

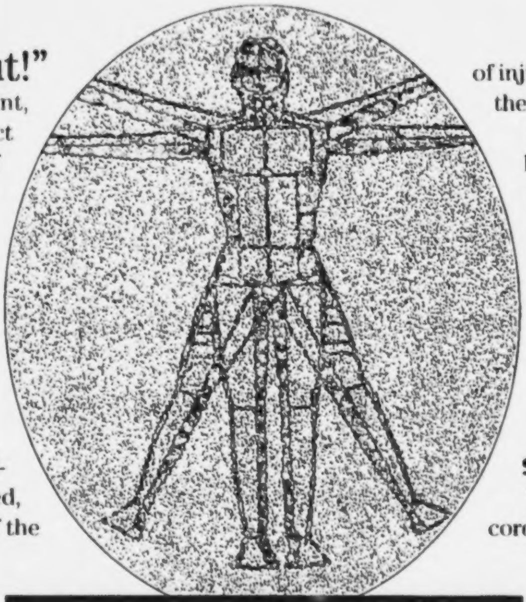
LIFTING AND CARRYING CHILDREN WITH SPECIAL NEEDS:

Back Injury Prevention for Parents



By Carolyn O. Cantu, MS, OTR

"My back went out!" Sounds like a familiar complaint, especially from parents and direct support professionals (DSPs) of people with disabilities. The daily parenting tasks for exceptional children are a special challenge. A typical day involves bending, lifting and carrying the children, their orthotic devices, therapy equipment and wheelchairs. Transport occurs in and out of cars, vans and the house. There may be transfers from the wheelchair in and out of the tub, the bed, and the feeding chair, or on and off the toilet. Consequently, lower back pain and back injuries are a frequent occurrence, but there are prevention measures available.

The U.S. Department of Labor reported that in 1994, overexertion and handling of heavy objects led to 330,000 back injuries; the annual figure is now more than 370,000. More than 85 percent of adults—most between the ages of 35 and 55—have periods of intermittent or chronic low back pain. Labor reports also show that the longer a worker continues at a job requiring lifting, the higher the risk for back injury. Although specific statistics are unavailable, it is reasonable to extrapolate these numbers to the parents and DSPs of children with special needs. By nature of the role, parents of young children and children with disabilities fall into that high-risk category. You may have been or are presently among the parents suffering with back pain or injury. As long as you are lifting, carrying and transferring children, this information is for you.

Usually, the cause of back pain is an injury resulting from lifting a heavy object or executing an abrupt movement. Most typically, the offending action is lifting combined with a twisting motion. Recurrence is very common after the first episode because muscles have been weakened. This is significant for an employed parent, because the recurrence of injury results in additional time lost on the job.

Each year, Americans lose 93 million days of work to back injury or pain, at a cost of $11 billion. Direct medical expenses add another $20 million or so. That is a lot of time off the job, and at a high price. Chances are most of us do not have that many sick days—or discretionary income—to spare for one injury.

Spinal Anatomy Simplified

The back is made up of the spinal cord running through the center openings (foramen) of the vertebral bones, intervertebral discs, ligaments, nerves and muscles. The 33 vertebral bones are stacked up one upon the other and aligned into five sections, from the neck down: 7 cervical, 12 thoracic, 5 lumbar (the largest; they bear the most stress), 5 sacral and 4 coccyx. Of the 33 vertebrae, 24—ranging from the neck through the lower back—are movable. The bones in the sacrum and the coccyx are fused so they do not move. The vertebrae are arranged in an S curve; each is separated from the next by an intervertebral disc (cushion). Stability of the lower back depends on the integrity of the vertebral bones and intervertebral discs. Disorders and displacements of these discs are common causes of lower back pain. The muscles that surround these bones move the vertebral column. Interestingly enough, they are not the muscles that aid in keeping the body erect and stable. That work is done by the hip and thigh muscles, which are not solely responsible for posture and movement. Strong abdominal muscles are essential to maintaining a strong, stable back, enabling ease of trunk movement. The most common structures injured lie within the lower lumbar area. These include the 5 lumbar bones of the vertebral column, the discs between those bones and the muscles sup-

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

continued from page 46

porting that section of vertebrae. Consequently, lower back injury and pain run along the lower portion of the back under the waist and between the hips.

Back Pain Triggers

Common causes of back pain include improper spinal alignment, improper posture in sitting and standing, and improper lifting and carrying. Consequently, when alignment, posture and movement techniques are neglected, injury or strain are likely to occur.

There are two classifications of back pain, acute and chronic. Acute attacks are experienced as sudden lower-back tension or stiffness, or as muscle spasms with sharp pain. Frequently, the pain runs across the upper portion of the buttocks and occasionally down the back of the leg. Quite often, the person is frozen in position and slides to the floor to lie down. This is very disturbing when caring for children, especially when a child is totally dependent on the parent's well-being. Chronic back pain is characterized by constant discomfort lasting three months or more. It is usually caused by repeated or unhealed injuries to the same area. Episodes of recurrent or intermittent pain occur over the years.

Proper lifting from a standing position involves keeping the child centered, as well as making contact with the palms of your hands.

Proper lifting from a kneeling position involves bending the knees, maintaining the natural curve of the back, and keeping the child close.

Common childcare situations that trigger improper lifting and carrying include lifting a child from the side (using a twist-and-lift pattern of movement), lifting and carrying on the hip, or lifting and twisting to put the child in a crib, enclosed play area, high chair or wheelchair. Other injuries occur while transferring large play or therapy equipment from one location to another, carrying two children at the same time, or carrying an infant or toddler while leaning to the side to hold an older child's hand.

Avoiding or Ameliorating Back Pain

By applying simple techniques to daily activities, parents and DSPs can reasonably expect to reduce back injury and pain.

PREPARATION: Simple preparation before every lift will ease the procedure.

- Stretch and flex all large muscles in back and limbs.
- Know the weight of the person. If the person weighs more than 30 pounds, get help or use a sliding or wheeled platform.
- Check the transport area, ie, the route between where the person is and where he is going. Check for obstacles and tripping hazards. Correct the pathway, if necessary.
- Observe stairs, ramps, curbs, inclines, walking space and blind corners.
- Check the area on which you intend to place the child. Make sure it is cleared, sturdy and at a comfortable level.

BODY MECHANICS: Body mechanics use the forces of gravity and inertia to advantage by determining the best possible positions to reduce stress or strain to the back. Practicing these mechanics might be an effort at first, but as they are put into daily practice they will become second nature.

- Maintain the natural S curve of the back. Do not straighten your back to an unnatural line.
- Bend the knees to use the large hip and knee joints and the strong leg muscles for lifting.

BEST COPY AVAILABLE

Keys to Prevention of Back Injury

- Maintain proper posture
- Keep natural back curve
- Use a wide base of support
- Maintain a low center of gravity
- Keep child close to the center of your body
- Do not twist while carrying a child
- When possible, slide instead of lift
- Use lifting equipment when necessary
- Consult with therapist about the best lifting principles for you and your child

- Tighten the stomach muscles, thus stabilizing the pelvis and spine.
- Maintain a wide base of support by standing with your feet under your shoulders. Balance is weakened if the feet are closer together or wider apart than shoulder width. When lifting a child from the front, your base of support is your two feet, separated, one slightly in front of the other. If your balance wavers, the back foot is ready to catch the sudden shift of weight and center of gravity.
- Keep the center of gravity low and within your base of support.

LIFTING AND CARRYING: Attend to the child. Do not allow yourself to become distracted.

- While lifting and carrying, keep the child close to your body and centered. If possible, have the child's legs straddle your waist. Carrying a child on one hip shifts your alignment to that side, putting a greater strain on your back.
- Lift only to waist level. Any overhead lifting puts a greater strain on the vertebrae.
- When lifting to carry toward another direction: Keep the child centered, place one foot in the direction of the lift, then move both feet in that direction.
- Move your entire body forward as a whole. Do not twist part of your body to place a child down. If you need to turn, turn by either pivoting or using small steps.
- While lifting, grasp the child firmly with the palms of your hands. If necessary, move the child slightly to one side to get a better grasp on his body. If lifting from the

continued from page 49

floor, rest the weight of the child on your knee or thigh until you get your hands in a secure position.

- Lift in stages if necessary. If, for instance, you are transferring a heavy child or a child with low muscle tone from the floor to the changing table, lift from the floor to a platform near the table, then from the platform to the table.
- Always ask for help with a child that weighs 30 pounds or more. If you are using a two-person lift, have the adult with the heavier part of the child (usually hips and bottom) say the "1,2,3 Lift" commands.
- Make sure you are able to see over or around the child's head as you move from one location to another. This is especially important as you travel down stairs or up and down curbs. If the child slips while being carried, lower her gently to the floor while maintaining a natural back position. Do not rotate.
- If transferring someone from a wheelchair to another surface, move the wheelchair as close to the surface as possible. After removing the side arm, if at all possible use a sliding board instead of lifting. Ask your child's therapist about correct sliding transfer methods.
- Consider infant/toddler bath seats or hydraulic lifts for bathroom lifts and transfers. Consult with your child's therapist.

STOP…THINK…LIFT…TRANSFER

Back pain and injury while caring for children with special needs are preventable. These thoroughly tested methods can significantly reduce the risk of recurrent injury and pain. Parenting children is physically demanding. Those demands can be met by using techniques that keep backs healthy, strong and free of injury and pain; they are well worth attention and practice. EP

Carolyn Cantu is a pediatric occupational therapist and educator formerly with the Infant Parent Program Austin, TX. She is presently writing articles for publications focusing on the care of children with special needs and their caregivers.

The Muscular Dystrophy Association

"There are no incurable diseases, only diseases for which cures have not yet been found."

That was the hope and the philosophy of a group of adults and parents of children with muscular dystrophy who joined in 1950 to form the Muscular Dystrophy Association. That premise continues to guide MDA's course today.

MDA is a voluntary health agency working to defeat more than 40 neuromuscular diseases through worldwide research, services and professional and public health education. The Association supports more research on neuromuscular diseases than any other private-sector voluntary organization in the world while also offering the most comprehensive array of services of any voluntary U.S. health organization.

WHAT DOES THE MDA DO?

Because of its unique array of services, the MDA was the first nonprofit organization honored with the American Medical Association's Lifetime Achievement Award "for significant and lasting contributions to the health and welfare of humanity." Its programs include:

Worldwide Research. MDA awards about $25 million in research grants each year to scientists around the world seeking treatments and cures for

organizational spotlight

When fraternal twins Aryn (left) and Erik (right) of Freeville, NY weren't walking by age 2, their mom Stephanie immediately suspected Duchenne muscular dystrophy. At age 5 the twins were put on the steroid prednisone. Aryn had heel cord and tendon release surgeries at age 8, and soon after began using a wheelchair. Erik walked until he was 10 years old, and now, at age 12, can take steps when wearing full-length braces. The boys also have learning disabilities, an occasional side effect of DMD. They enjoy swimming, therapeutic horseback riding, Nintendo, MDA summer camp and spending time with their two sisters and older brother, none of whom have muscular dystrophy.

Mattie J.T. Stepanek, 12, of Upper Marlboro, MD has mitochondrial myopathy, which affects his body's "autonomic" or "Automatic" functions. The condition causes generalized muscle weakness and also creates difficulty in regulating many body functions such as heart rate, digestion and breathing. When he was younger, Mattie could walk and even earned a black belt in karate, but now he uses a power wheelchair, a ventilator and extra oxygen as needed. Mattie still maintains a remarkable zest for life. A best-selling poet with a passion for peacemaking, Mattie is focused on making the most of his time. Mattie is the 2002 MDA National Goodwill Ambassador.

continued from page 52

the diseases in its program. MDA-sponsored researchers have made groundbreaking discoveries about the underlying genetic causes of virtually every genetic neuromuscular disease. In some cases, treatments which slow progression or ease symptoms have also been identified. MDA is currently funding research on several promising fronts, including the use of donated stem cells, gene therapy and drug therapy.

Nationwide Services Program. The Association provides a network of more than 230 hospital-affiliated medical clinics across the country, each staffed by doctors familiar with these rare conditions, as well as social workers, physical and respiratory therapists and other health professionals. Services are administered through local MDA offices and include free flu shots; assistance with the fitting, purchase and repair of wheelchairs and leg braces; loan closets of durable medical equipment; and parent and patient support groups.

Summer Camp Last year more than 4,000 children ages 6 to 21 spent a free week at camp - what many call "the best week of the year." Each camper is paired with a volunteer counselor who helps the child with practical matters and makes sure s/he joins in the fun.

Professional and Public Health Education MDA sponsors publications for affected families and for the general public about neuromuscular disorders, convenes international scientific meetings, and holds conferences of MDA clinic directors and their associates. An award-winning bimonthly magazine, *Quest*, and a series of pamphlets geared to those with new diagnoses help people stay on top of news and understand the effects of the disorders. Online support and information is available at http://www.mdausa.org, with materials in Spanish at http://www.mdaenespanol.org. Preschool disability awareness education is provided through MDA's Hop-a-Thon program in daycare centers and preschools.

WHAT IS A NEUROMUSCULAR DISEASE?

There are eight categories of neuromuscular diseases under the MDA umbrella. Among these are diseases that manifest at birth, those that present in early and late childhood and those that appear in adulthood. The underlying causes, levels of severity and rates of disease progression vary among the categories and the individual disorders.

All neuromuscular disorders cause weakness and wasting of voluntary skeletal muscles, but not all are life-threatening. Some forms are fatal in infancy, childhood or young adulthood, or within a few years of diagnosis, while others – although progressively debilitating – allow for a normal lifespan.

WHICH DISORDERS ARE COVERED BY MDA?

The following eight disease groups are the MDA's main focus:

Muscular Dystrophies Missing or defective proteins in the cells of voluntary muscles cause weakness and wasting over time. When the respiratory muscles are involved, death can occur in adolescence or young adulthood. Some forms spare respiratory muscle and target muscles in the trunk, arms, legs, neck and face instead. Muscular dystrophies include Duchenne, Becker, Emery-Dreifuss, limb-girdle, congenital and myotonic.

Motor Neuron Diseases Progressive degeneration of motor nerve cells in the spinal cord prevents the transmission of signals to the muscles. This group includes several childhood forms of spinal muscular atrophy (SMA).

Metabolic Diseases of Muscles These are caused by inherited chemical deficiencies of a specific enzyme, such as phosphorylase (McArdle's disease), acid maltase (Pompe's disease) or carnitine palmitoyl transferase.

Diseases of Peripheral Nerves These diseases include Friedreich's ataxia (characterized by shaky movements and unsteadiness) and Charcot-Marie-Tooth disease, which weakens the feet, lower legs, hands and forearms.

Inflammatory Myopathies The immune system is implicated in potentially debilitating disorders of

continued from page 55

skeletal muscle, such as polymyositis and dermatomyositis. These diseases cause weakness of the pelvis, shoulders and limbs and may involve difficulty in swallowing.

Diseases of the Neuromuscular Junctions Conditions such as myasthenia gravis and congenital myasthenic syndrome (which is detectable at birth) cause problems with eye movement, facial expression, chewing, swallowing, respiration and, occasionally, arm and leg movement.

Myopathies Due to Endocrine Abnormalities Disorders of the thyroid can affect muscle function, sometimes causing weakness and wasting, while in other instances causing stiffness and painful cramps.

Other Myopathies This group of unrelated genetic muscle disorders (such as central core disease, nemaline myopathy, myotubular myopathy and mitochondrial myopathy) may cause diffuse weakness, some skeletal defomities and progressive muscle wasting, among other symptoms.

HOW DOES MDA FUND ITS PROGRAMS?

MDA has never received any federal funding. All funds come from private contributors, as well as national corporate and organizational sponsors.

Each year on Labor Day weekend, MDA presents the Jerry Lewis MDA Telethon—its trademark event. The broadcast boasts 21 hours of nonstop celebrity entertainment, information and recognition of donors, appealing to approximately 60 million viewers.

Each year, some 2 million volunteers participate in MDA's fund-raising, service and educational programs. This outpouring of support makes it possible for MDA to make good on its slogan: "Help for today, hope for tomorrow."

For more about MDA, look in your telephone book for the nearest MDA office; call (800) 572-1717; visit http://www.mdausa.org; or e-mail mda@mdausa.org. ■

Remember to tune into the 2002 Jerry Lewis MDA Telethon on Sept. 1-2 on the MDA "Love Network" station in your area.

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

ADAPTED SPORTS AND RECREATION

TECHNOLOGY AND EQUIPMENT

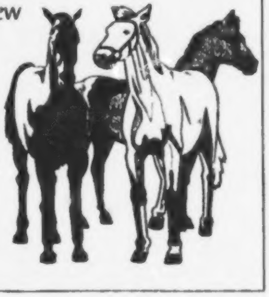
Adapted sports and recreation, a concept born in the early 1970's, is beginning to take a more prominent role in improving the quality of life for people with disabilities. The number of people with disabilities who engage in sports and other physical activities has increased dramatically in the past decade, due to the growing field of assistive sports and recreation equipment. Whether for competition, recreation or physical rehabilitation and development, the sports and recreation equipment market has developed many devices to encourage people with disabilities to participate in sporting events and programs.

Before programs like the Special Olympics, most children and adults with disabilities, health care professionals, and caregivers focused on basic life skills, needs and comforts. After years of realizing that that is not enough, the trend began to shift to organized physical activity as both a recreational release and a way to improve and maintain the health of people with disabilities. The results have been widespread.

EQUESTRIAN SPORTS

Equestrian sports have recently become very popular, as the technology has improved comfort for the rider. New equipment designs include:

- seats that have velcro straps and leg bands with seat covers
- saddle hand straps
- seat cushions and seat rolls to assist with balance and stability
- custom saddles
- mounting ramps and steps



AQUATIC THERAPY PROGRAMS

Aquatic activities promote good muscle tone, lung capacity, flexibility and overall fitness without causing undue pressure on the joints and bones. Adapted equipment available for swimming includes:

- flotation vests
- swim fins
- water wings
- swim rings and head floats, all available to help keep the swimmer above water
- goggles for eye safety
- pool lifts and transfer tiers that help wheelchair users and non-ambulatory people transfer safely in and out of the pool

Specialty swimwear is also available that is lightweight, buoyant and insulated to protect against body heat loss with full-length side zippers or velcro fasteners, so that dressing is more manageable. There are specialty wheelchairs, including underwater and beach wheelchairs, parallel bars to aid in water ambulation and moveable swimming pool floors and platforms operated by hydraulic lifts.

MARTIAL ARTS, DANCE THERAPY AND AEROBICS

Martial arts, dance therapy and aerobics promote individualized fitness, wellness, cardiovascular endurance and muscular strength. Two therapeutic programs are chair aerobics and modified dance. Equipment needs are minimal, requiring only the appropriate amount of space, comfortable clothing that covers the body to keep muscles warm, suitable footwear and some music. It is very important to have a professional instructor who can help ensure the safety of the dancers.

An AbilityFirst karate class learns typical martial arts moves with the help of instructors and Arnold Schwartzeneggar.

BASKETBALL

A popular sport adapted for people with disabilities is wheelchair basketball. This is a team sport and therefore promotes good sportsmanship. This sport also improves overall health and strength as well as increases endurance and enhances fine motor skills. Some adapted equipment for this sport includes:

- *spoke protectors*
- *adjustable basketball hoop and posts*
- *specially-designed sport wheelchairs that are more easily maneuvered*

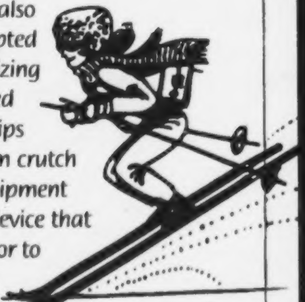
WINTER SPORTS



Technology advancements have also increased participation in adapted winter sports, such as skiing utilizing ski stabilizers; ski handles designed to teach the user to keep ski tips together; and a flip ski, or forearm crutch with a ski attachment. Other equipment includes an all-terrain ski TD, a device that attaches the ski pole to the wrist, or to a prosthesis, and a four-piece boot shell device for skier's with lower extremity/ mobility disabilities.

ABILITYFIRST

AbilityFirst is a non-profit organization located in Southern California that focuses much time and energy on providing adaptive sports and recreation equipment and programs for its clients. With its newest affiliate, MindBodySpirit, AbilityFirst has provided programs and services to people with physical and developmental disabilities for the past 76 years. AbilityFirst operates a network of 22 facilities throughout southern California, including community centers, adult vocational training centers, accessible housing complexes and accessible camps.

MindBodySpirit specializes in providing innovative martial arts training and adapted movement programs to children and adults with physical and developmental disabilities. AbilityFirst's MindBodySpirit adapted movement program includes activities such as:

- swimming
- basketball with AbilityFirst's wheelchair basketball team, the Los Angeles Stars (sponsored by the Los Angeles Lakers)
- drill team (adapted dance and aerobics team)
- ski school
- instruction in healthy living
- joint efforts with the Special Olympics and the Los Angeles Marathon

AbilityFirst community centers are equipped with accessible playgrounds, including equipment such as:

- safety swing chairs with straps
- wheelchair transfer ramps
- swing bridges for balance and gross motor development
- specially designed stairway play steps to assist with hand/foot coordination
- toss ball courts
- synthetic rubber mats under the playgrounds, to allow for easier wheelchair mobility.

AbilityFirst pools are equipped with bell bars for coordination and movement; aquatic noodles that provide flotation support and allow non-swimmers to improve their range of motion through leg kicks; hoyer lifts; and walking ramps so that clients can safely enter and exit the pools. AbilityFirst camps are completely accessible through equipment such as mounting ramps for equestrian sports and bowling ramps that allow bowling balls to be released from either a standing or sitting position.

The heart of AbilityFirst's philosophy is to encourage and seek to inspire individuals with developmental and physical disabilities to realize their full potential.

"The MindBodySpirit teaching philosophy is simple," states Stephanie Ivler, Chief Operating Officer and instructor for MindBodySpirit. "We strive to create an atmosphere conducive to excellence and then we step back and watch the students blossom. The adapted movement program is uniquely designed for our very special students to teach sports skills, to foster success in attaining learning objectives and to create opportunities for positive athletic experiences."

Adapted sports and recreation departments and programs have become an integral part of the offerings from adapted physical educators at universities such as Cal Poly in Pomona, CA, East Carolina University in Greenville, NC, and the Texas Women's University. Some city recreation departments including Pasedena, CA, Salt Lake City, UT, Carson City, NV. and Dayton, OH provide adapted recreation programs as part of the offerings at their community centers. All adapted sports and recreation departments have resources and adapted equipment available to ensure maximum benefits to the disabled recreation enthusiast. EP

For more information on adaptive sports and recreation equipment and programs, contact your local school or university's physical education departments and your local service agencies, or contact AbilityFirst's MindBodySpirit at (626) 396-1010. You may also visit AbilityFirst's website at www.abilityfirst.org.

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

HYPERBARIC OXYGENATION FOR THE COMATOSE CHILD

There is some hope for the comatose child suffering from severe brain injuries, cerebral palsy, or anoxic encephalopathy. Children with Glasgow Coma scales from 3-5 present tremendous financial and emotional burdens, since these little ones may live for many years. When considering care of tracheotomy, gastric tube for feeding, physical therapy, occupational therapy, speech therapy, nursing care, recurrent hospitalizations, medications, vans, and modifications to the home, expenditures may represent multi-million dollars.

Intensive hyperbaric oxygenation is no miracle, but it provides some hope. In certain instances the child is able to communicate verbally, by computer or word board. Eighty percent have the G-tube removed and seventy percent have the tracheotomies closed. Frequently, bowels become normal and nutrition is re-established. Routine monthly medications are reduced and hospitalizations are markedly decreased. Although few children will return fully to society, substantial improvements will give them a better quality of life in addition to a ninety percent reduction in overall costs.

For more information on hyperbaric oxygenation therapy and life planning, call the Ocean Hyperbaric Neurologic Center at (800) 552-0255.

Coming Soon!

Hyperbaric Oxygenation for Cerebral Palsy and the Brain-Injured Child..

by R. A. Neubauer, M.D.

Dr. Neubauer's new book is a complete guide written for the professional as well as the caregiver of exceptional children. The book describes the latest information on hyperbaric oxygenation therapy including improved brain function as visualized through functional imaging. Clinical and scientific data along with references are included.

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

NCP
VNS
THERAPY™
VAGUS NERVE STIMULATION
Cyberonics

BEST COPY AVAILABLE

VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

929

EXECUTIVE SUMMARY[1]
SAFETY INFORMATION
FOR THE NCP® SYSTEM

INTENDED USE / INDICATIONS – UNITED STATES

The NCP System is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications.

CONTRAINDICATIONS

- The NCP System cannot be used in patients after a bilateral or left cervical vagotomy.
- Do not use short-wave diathermy, microwave diathermy, or therapeutic ultrasound diathermy on patients implanted with the NCP System. Diagnostic ultrasound is not included in this contraindication.

WARNINGS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals. This is not intended to serve as a substitute for the complete NCP System Physician's Manual.

⚠ The **safety and efficacy** of the NCP System has not been established for uses not covered in the "Intended Use/ Indications" section of the manual.

⚠ The safety and efficacy of the NCP System treatment has not been established for stimulation of the **right vagus nerve** or of any other nerve, muscle, or tissue.

⚠ **Excessive stimulation** at a combination of high frequency (≥ 50 Hz) and an excess duty cycle (that is, one that occurs when ON time is greater than OFF time) has resulted in degenerative nerve damage in laboratory animals. An excess duty cycle can be produced by continuous or frequent magnet activation (> 8 hours), as determined by animal studies. Cyberonics recommends against stimulation at these combinations of ranges.

⚠ **Aspiration** may result from the increased swallowing difficulties reported by some patients during stimulation. Patients who have **pre-existing swallowing difficulties** are at greater risk for aspiration.

⚠ **Device malfunction** could cause painful stimulation or direct current stimulation. Either event could cause nerve damage and other associated problems. Patients should be instructed to use the magnet to stop stimulation if they suspect a malfunction, and then to contact their physician immediately for further evaluation. Prompt surgical intervention may be required if a malfunction occurs.

⚠ Susceptible patients with predisposed cardiac conduction systems (re-entry pathway) have not been studied as part of controlled clinical trials to establish the safety of NCP system treatment in these patients. Evaluation by a cardiologist is recommended if the family history, patient history, or electrocardiogram suggests an abnormal cardiac conduction pathway. Serum electrolytes, magnesium, and calcium should be documented before implantation. Post-implant electrocardiograms and Holter monitoring are recommended if clinically indicated.

⚠ **Sudden unexplained death in epilepsy (SUDEP):** Through August 1996, 10 sudden and unexplained deaths (definite, probable, and possible) were recorded among the 1,000 patients implanted and treated with the NCP device. During this period, these patients had accumulated 2,017 patient-years of exposure. Some of these deaths could represent seizure-related deaths in which the seizure was not observed, at night, for example. This number represents an incidence of 5.0 definite, probable, and possible SUDEP deaths per 1,000 patient-years. Although this rate exceeds that expected in a healthy (nonepileptic) population matched for age and sex, it is within the range of estimates for epilepsy patients not receiving vagus nerve stimulation, ranging from 1.3 SUDEP deaths for the general population of patients with epilepsy, to 3.5 (for definite and probable) for a recently studied antiepileptic drug (AED) clinical trial population similar to the NCP System clinical cohort, to 9.3 for patients with partial onset epilepsy.

⚠ **The NCP device is not curative:** Physicians should warn patients that the NCP System is not a cure for epilepsy and that since seizures may occur unexpectedly, patients should consult with a physician before engaging in un-supervised activities, such as driving, swimming, and bathing, and in strenuous sports that could harm them or others.

⚠ **Obstructive Sleep Apnea:** Patients with obstructive sleep apnea (OSA) may have increased apneic events during stimulation. Cyberonics recommends care when treating patients with preexisting OSA. Lowering stimulus frequency or prolonging OFF time may prevent exacerbation of OSA.

PRECAUTIONS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals.

⚠ **Laryngeal irritation** may result from stimulation. **Patients who smoke** may have an increased risk of laryngeal irritation.

⚠ **Dyspnea** may result from stimulation. **Patients with chronic obstructive pulmonary disease** may have an increased risk of dyspnea.

⚠ It is important to follow **recommended implantation procedures and intraoperative product testing** described in this manual. During the intraoperative Lead Test, rare incidents of bradycardia and/or asystole have occurred. As of October 1998, approximately 3,000 patients had been implanted with the NCP System. Four of these patients were reported to have experienced **bradycardia and/or asystole** during the intraoperative Lead Test. All four patients recovered without sequelae. One of the four patients was implanted with the NCP System. There were no postoperative or VNS-treatment-related cardiac adverse events later reported for that patient. No similar events were reported to have occurred during the clinical studies at the time of implantation or during treatment. The safety of this therapy has not been systematically established for patients experiencing bradycardia or asystole during NCP System implantation.

⚠ **Reversal of lead polarity has been associated with an increased chance of bradycardia** in animal studies. It is important to make sure that the Lead connector pins a correctly inserted (white marker to + connection) into the Pulse Generator header.

⚠ It is important to follow **infection control procedures**. Infections related to any implanted device are difficult to treat and may require that the device be explanted. Cyberonics recommends that the patient be given antibiotics preoperatively. The surgeon should ensu that all instruments, including the NCP Tunneling Tool, are sterile prior to the operation.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve** in the neck area inside the carotid sheath.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve below wher the superior and inferior cervical cardiac branches separate from the vagus nerve.**

⚠ A **neck brace** can be used by the patient for the first week to help ensure proper Bipolar Lead stabilization.

Environmental and Medical Therapy Hazards

⚠ Patients should exercise reasonable caution in avoiding devices that generate a **strong electric or magnetic field.** (For examples, see the "Other Environmental Hazards" sectio of the Physician's Manual.) If a Pulse Generator ceases operation while in the presence o electromagnetic interference (EMI), moving away from the source may allow it to return to its normal mode of operation.

⚠ NCP System operation **should always be checked** by performing device diagnostics afte any of the procedures mentioned in the Physician's Manual.

⚠ Because of where the Pulse Generator is implanted in the chest, **patients may need to b specially positioned in mammography equipment for clear imaging.** Otherwise, the device may be seen as a shadow on the mammogram. (Most routine diagnostic procedur such as fluoroscopy and x-radiography, are not expected to affect system operation.)

⚠ **Therapeutic radiation** may damage the Pulse Generator's circuitry, although no testing h been done to date and no definite information on radiation effects is available. Sources of such radiation include therapeutic x-rays, cobalt machines, and linear accelerators. The radiation effect is cumulative, with the total dosage determining the extent of damage. The effects of exposure to such radiation can range from a temporary disturbance to permaner damage, and may not be detectable immediately.

⚠ **External defibrillation** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for external defibrillation.

⚠ **Electrocautery surgery** may damage the Pulse Generator. Please refer to the Physician Manual for complete instructions for electrocautery surgery.

⚠ **Magnetic resonance imaging** (MRI) should not be performed with a magnetic resonance body coil in the transmit mode. The heat induced in the Bipolar Lead by an MRI body scan can cause injury.

Use caution when other MRI systems are used, since adverse events may occur because different magnetic field distributions

⚠ No scan in which the radiofrequency (RF) is transmitted by the body coil should be done o a patient who has the NCP System. Thus, protocols must not be used which utilize local coils that are RF-receive only, with RF-transmit performed by the body coil. Note that som RF head coils are receive only, and that most other local coils, such as knee and spinal coils, are also RF-receive only. **These coils must not be used in patients with the NCP System.**

⚠ **Therapeutic ultrasound.** Routine therapeutic ultrasound could damage the Pulse Generator and may be inadvertently concentrated by the device, causing harm to the patient.

⚠ **Extracorporeal shockwave lithotripsy** may damage the Pulse Generator. If therapeutic ultrasound therapy is required, avoid positioning the Pulse Generator part of the body in th water bath or in any other position that would expose it to ultrasound therapy. If that positioning cannot be avoided, program the Pulse Generator output to 0 mA for the treatment, and then after therapy, reprogram the Pulse Generator to the original parameters.

Diagnostic ultrasound is not expected to affect the NCP System.

⚠ The Pulse Generator may affect the operation of **other implanted devices,** such as card pacemakers and implantable defibrillators. Possible effects include sensing problems and inappropriate Pulse Generator responses. If the Pulse Generator patient requires concurrent implantable pacemaker and/or defibrillator therapy, careful programming of ea system is necessary to optimize the patient's benefit from each device.

ADVERSE EVENTS

Adverse events reported during clinical studies as statistically significant are listed in alphabetical order Ataxia (muscle movements or twitching, generally associated with stimulation); Dyspepsia (indigestion); Dyspnea (difficulty breathing, shortness of breath); Hypesthesia (impaired sense of touch); Increased coughing; Infection; Insomnia (inability to sleep); Laryngismus (throat, larnx spasms); Nausea; Pain; Paresthesia (prickling of the skin); Pharyngitis (inflammation of the pharn throat); Voice alteration (hoarseness);Vomiting.

Other potential adverse events possibly associated with surgery or stimulation include but are limited to the following:

Aspiration (fluid in the lungs); Blood clotting; Choking sensation; Damage to nerves or vasculature the surgical area, including the carotid artery and jugular vein; Device (Generator and/or Lead) migration or extrusion; Dizziness; Dysphagia (difficulty swallowing); Duodenal ulcer, gastric ulcer; Ear pain; Facial flushing; Facial paralysis, paresis; Foreign body reaction to implants, including possible tumor formation; Formation of fibrous tissue, pockets of fluid; Heart rate and rhythm changes; Hiccuping; Incision site pain; Irritability; Laryngeal irritation (sore, painful throat); Left hemidiaphragm paralysis; Left recurrent laryngeal nerve injury; Left vocal cord paralysis; Low-grad fever; Muscle pain; Neck pain; Nerve injury; Painful or irregular stimulation; Skin, tissue reaction; Stomach discomfort; Tinnitus (ringing in the ears); Tooth pain; Unusual scarring at the incision sit Urinary retention; Vagus nerve paralysis; Weight change; Worsening of asthma and bronchitis; Worsening of cardiac abnormalities, including heart rate and rhythm.

⚠ Patients who manipulate the Pulse Generator and Bipolar Lead through the skin may dama or disconnect the Bipolar Lead from the Pulse Generator and/or possibly cause damage to vagus nerve.

---

[1] The information contained in this Executive Summary for Physicians represents partial excerpts of important prescribing information taken from the *NCP Pulse Generator Physician's Manual*. The information is not intended to serve as a substitute for a complete and through understanding of the material presented in all of the Physician Manuals for the NCP System and its component parts nor does this information represent full disclosure of all pertinent information concerning the use of this product, potential safety complications, or efficacy outcomes.

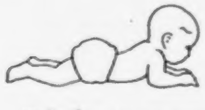
Is Your Baby Okay?

Watch for these signs that may indicate physical delays*

BY 3 MONTHS*

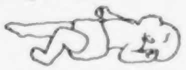
Normal Development



☐ Pushes up on arms
☐ Holds head up

Signs to Watch for

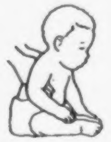
☐ Difficulty lifting head
☐ Stiff legs



☐ Pushes back with head
☐ Constantly fisted hand and stiff leg on one side

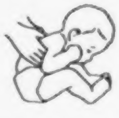
BY 6 MONTHS*

Normal Development

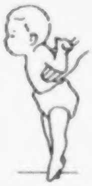


☐ Sits with support
☐ Holds head up
☐ Straight back

Signs to Watch for



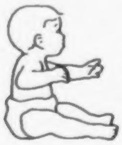
☐ Unable to lift head
☐ Rounded back
☐ Stiff arms



☐ Arms held back
☐ Stiff, crossed legs

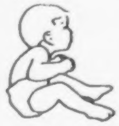
BY 9 MONTHS*

Normal Development

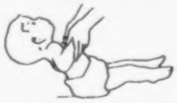


☐ Sits without support
☐ Arms free to reach and grasp

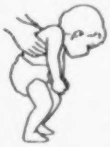
Signs to Watch for



☐ Rounded back
☐ Poor use of arms



☐ Difficult to get arms forward
☐ Arches back, stiff legs



☐ Poor head control
☐ Poor ability to lift head and back
☐ Will not take weight on legs

Watch for these signs of speech and hearing delays*

3 MONTHS*

☐ Does not quiet in response to sound or voice
☐ Does not cry differently depending on purpose
☐ Does not coo or vocalize other than crying

6 MONTHS*

☐ Does not smile in response to speech
☐ Does not begin to use consonant sounds in babbling

9 MONTHS*

☐ Does not smile or laugh while looking at you
☐ Does not turn to sounds or reach for objects
☐ Does not use voice to get help and attention

*90% of babies do these movements by the ages indicated. Remember to correct your child's age for prematurity.

Early detection is the best prevention!

Mark a check (✓) by any of these signs that you see in your baby. Or, write your concerns in a notebook to share with your child's doctor. It is important to keep track of your child's development so they get the best start in life.

THE JUNGLE OF UNOLAND:

A Fable for Our Time

Explaining the war on terrorism to young children

by Vidya Bhushan Gupta, MD

Once upon a time, in the jungle of Unoland, there lived a family of lions: Papa Lion, Mama Lion and two cubs, Manny and Maria. They had a nice den with a personal corner for each cub, and a backyard with flowers and shrubs. In the backyard they had a patio, where they could meet with the other animals of the jungle.

During the day, Papa and Mama Lion worked in the jungle collecting food for the cubs, and things for their den. Mama and Papa lion did not fight with other animals. All the animals respected them because they never bullied anyone. Once they even put Manny in time-out for pushing Matthew the colt during a race. Any animal that had a problem came to the Lions for help and advice.

Every month the lions threw a party to which they invited all the animals of Unoland and friends from neighboring jungles. Once they invited Sammy the bear from the jungle of Rubyland to their party. Sammy the bear did not bring Mrs. Bear and their cubs with him. He believed that only Papa Bear should go to meet other animals, while Mrs. Bear should take care of the cubs and cook and clean. He believed that parties could spoil cubs, who should learn to hunt and catch their prey. He did not like to give parties. He bullied other animals to do things for him.

Sammy did not like what he saw at the Lions' party. He did not like Mama and Papa lion dancing together. He was especially mad at Muny the bear, who was dancing with Ronnie the rabbit and Chunky the Squirrel.

"Isn't Muny ashamed of dancing with little animals?" Sammy thought. "How could a bear that is so big and so strong dance with squirrels and rabbits?"

Sammy was jealous, too. "There is so much food and grass and so many trees and shrubs in Unoland, while Rubyland is so poor," he thought.

When the party was over, Sammy said good-bye to Papa Lion and went back to Rubyland thinking how much he disliked Unoland. He was mad at Papa Lion for giving too much freedom to the weaker animals. He wondered how he could teach Papa Lion, and the animals of Unoland, a lesson.

Sammy called a meeting of all the male bears of the world including Muny and...

Calling all artists!

EP wants pictures of the characters in this story for possible publication in an upcoming issue. Read the rest of the tale at http:/www.eparent.com and send in your child's illustrations!

Dr. Gupta is Director of the Dept of Developmental Pediatrics at Metropolitan Hospital in New York City. Dr Gupta uses the fable to explain to young children about the war on terrorism, and to help them to differentiate between good people and bad ones. The story can also help young children distinguish between good and necessary fighting, such as the war on terrorism, or bad fighting, in school or on the street.

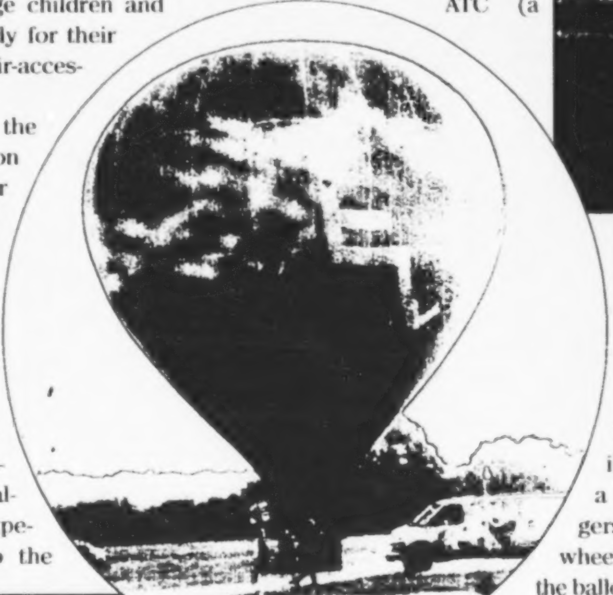
SERENA'S SONG

by Carolyn Cantu

As the early morning sun rose slowly over the skyline, a hot air balloon called Serena's Song lifted into the air over Zilker Park in Austin, Texas. On this clear, cool May morning, wheelchairs were lined up in three rows. School-age children and elderly alike waited expectantly for their turns to ride the first wheelchair-accessible hot air balloon.

After a dramatic burst of the blowtorch beneath, the balloon rose about 100 feet into the air and squeals could be heard from inside the adapted basket. Tethers attached to trucks and held by crew members controlled its rise. Gary Waldman, father of the girl for whom Serena's Song is named, controlled a tether from the ground while his partner, Phil Gray, piloted the balloon. Their confidence and experience were unmistakable to the group of would-be travelers and their caregivers.



Serena is a young woman with severe cerebral palsy. Seventeen years ago, Mr. Waldman took his then two-year-old daughter on a hot air balloon ride. Prior to this adventure, Serena had been unable to express recognizable emotion. Her father recalls that as the balloon took off, she squealed with delight and gave a shrill cry of happiness. Mr. Waldman's own thrill at hearing his daughter express such joy inspired him to attempt to provide others with this unusual experience. He hoped that the excitement of being lifted so high off the ground might stimulate other non-communicative children and adults to express emotion. Serena's Song is the balloon that has made this possible.

Approved by the Federal Aviation Administration (FAA) and sponsored by ATC (a transit operations service provider specializing in transportation for riders with disabilities), the balloon is built to carry a 250-pound person in a 250-pound wheelchair. The basket is fitted with a special 48-inch door, wheelchair braces and a "window" that enables passengers to view the scenery from wheelchair level. Unique in its design, the balloon itself is emblazoned with the international handicapped logo, wearing a red heart, on a bright blue background.

Serena's Song travels all over the United States, giving the gift of flight to people who ordinarily view their environment from the height of their wheelchairs. Corporate sponsorship from ATC allows Serena's Song to provide these exciting rides to a large population throughout the country. By helping to replicate Serena's experience for others, Mr. Waldman has provided more than 10,000 people the joy and exhilaration that his daughter experienced years ago.

One message on the Serena's Song web site message board reads "God Bless You, Gary," a sentiment shared by many who have experienced or supported this adventure… including this writer!

For more information about Serena's Song, including a tour schedule, visit http://www.serenassong.com. EP

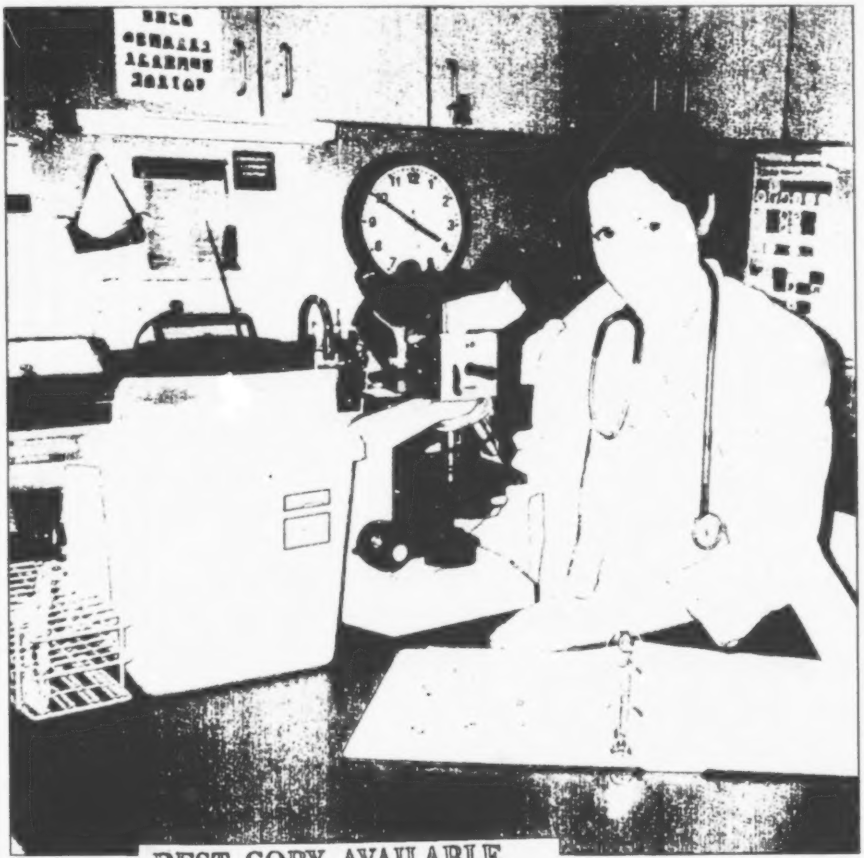
A Physician's Question

by Galina Psakhis, M.D.

It is Tuesday morning (my clinic day) and as usual, I am chatting with my nurse and looking at my busy schedule. I notice that Nathan C. is coming today for a physical. I smile and ask my nurse to let me know as soon as he arrives. I like Nathan's family, particularly his very devoted mother. Nathan has autism and mental retardation. I met his family several months ago when he had a problem with school placement because of his aggressive behavior and incontinence. Since then I have thought seriously about patient advocacy and tried to think in terms of how a parent or caregiver would think about the challenges of caring for a patient with a disability or chronic health care condition. I took it upon myself to find out what resources are available and to whom to refer parents for quality information. These kinds of things are not skill sets we learn in medical school or when we do specific rotations, yet they are critical to my profession as a physician.



BEST COPY AVAILABLE

Let me introduce myself. My name is Galina Psakhis, and I am a second year resident at ETSU Family Practice Residency Program in Johnson City, Tennessee. I am a foreign physician who emigrated to the US from Russia eight years ago. I was an experienced practicing pediatrician in my country, and so I felt quite confident when I started my residency until one night while I was on call at the hospital.

On this occasion, I had to evaluate a mentally retarded patient with severe abdominal pain. I will never forget my feelings: hopelessness and a desire to leave the room and call my senior resident for help. I have to admit that I was incompetent to communicate with the patient. Even to examine him was a big challenge. It seemed we both were frightened of each other, although I had no reason to be scared. My confession about this struggle on the morning report did not bring the comfort I had hoped for. I learned that most of the residents have had similar experiences. My problem was not a language barrier but a lack of confidence and experience working with mentally challenged patients.

As I reflect on my past, I do not recall treating any mentally retarded patients in my 12-year medical career. In Russia, mentally retarded patients do not live long, and if they do they live in institutions. The philosophy is that if you do not see it, you do not have a problem. Here, in America, many types of information and services as well as advanced medicine are available in most communities. Social and

Dr. Galina Psakhis with a patient in Johnson City, TN.

family support systems provide an opportunity for many disabled people to live a normal life and be an important part of society. Americans tend to view people with special needs not as problems to be confronted but as people to be respected.

Modern medicine, science and technology have provided great help and opportunities for people with special needs so as to afford them the chance to make a positive contribution to our society. However, there is still a great need for improvement, especially in the educational arena. As a practicing physician, I am struck by how little we know about people with mental retardation: how they live, their daily needs, and, most important, how to find the right way to support and communicate with them and their families.

It was the last month of my internship when I was on my rotation at the Morton J. Kent Habilitation Center at Orange Grove in Chattanooga, Tennessee, a center for people with special needs, when I discovered Exceptional Parent magazine. I found myself reading it cover to cover. The

THE MELMARK SCHOOL

2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Our approved private day and boarding school serves children ages 5-21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Acquired Brain Injuries
- Cerebral Palsy
- Mental Retardation
- Neurological Disorders

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK Ext. 636 or email admissions@melmark.org

Resident's Letter

continued from page 71

patient stories were uplifting and when I looked inside to review the editorial advisory board, I instantly recognized some of the leaders in medical science, technology and education. I found myself reading some more. EP magazine is a great resource of information and support for the special needs community as well as a valuable source of medical information. I consider it one of the best sources for physicians, nurses, parents and caregivers.

Recently, I also learned about educational projects in some residency programs involving parents of handicapped patients who work as teachers for medical professionals. The unique advantage of these projects is direct and personal contact between residents, parents and patients in their homes that helps physicians get a more realistic picture of what it is like to have a disabled child. Despite the success and importance of the parent teaching projects, however, they are not universal, but limited to several well-respected university residency programs.

Development of core-curriculum guidelines for all primary care oriented residency programs would be a real solution and a great benefit to all parents and physicians. In addition, I feel that using EP publications for medical education as a supplemental resource of information about disability is imperative to help medical students and residents gain more exposure to this field.

The reality is that many residents will start their practices after graduation and eventually have patients with mental retardation or other forms of disability. Do we have enough contact and practice working with handicapped patients and their families during our medical training? Are we not obligated to do this as physicians? After all, these patients need our care and expertise just as much as those whose disease states we can cure with medication or surgery. The fact that they may have a lifelong condition only exacerbates the need for more training and experience in this field.

I started my letter to EP in order to invite residents, physicians and nurses to share their experiences with chronically handicapped patients and their families and to discuss different opinions in order to help us build better patient-doctor partnerships. I want to invite parents and caregivers to share with us your experiences and what would you like to see change in your primary care physician relationship. Ironically, the information gap exists on both sides. That is why communication and teaching are crucial and beneficial for all of us.

Sincerely,
Galina Psakhis, MD EP

Mentoring on the Internet

by Sheryl Burgstahler, PhD

Most of us can think of people in our lives, more experienced than we, who taught us something new, offered advice, presented a challenge, initiated friendship or simply expressed an interest in our development as a person. They helped us negotiate an uphill path or find an entirely new path to a goal in our academic, career or personal lives. They showed us a world larger than our neighborhood. They pointed out talents we hadn't noticed in ourselves and stimulated ideas about what we might be able to accomplish. They nudged us when we needed a nudge.

The Benefits of Mentoring

Each participant benefits from communication with several mentors. As participants move from high school to college and careers they too become mentors, sharing their experiences with younger participants. Mentors offer protégés:

INFORMATION: Mentors share their knowledge and experiences with protégés, often helping them realize they have more choices than they thought.

CONTACTS: Mentors introduce their protégés to valuable academic, career and personal contacts.

CHALLENGES: Mentors stimulate

continued on page 74

Mentoring: How DO-IT Does It

Most of my time at the University of Washington over the past ten years has been spent establishing, securing funds for and directing project DO-IT. DO-IT stands for Disabilities, Opportunities, Internetworking and Technology. DO-IT's goal is to increase the academic and career success of individuals with disabilities. To date, we have focused most of our efforts on those challenging teen years, helping college-capable young people successfully transition to college and on to employment. For every challenge we undertake DO-IT asks, "What role can technology play in solving this problem?"

Introducing protégés to mentors with similar disabilities is a strength of the DO-IT program. Most DO-IT mentors are college students, postsecondary faculty and other professionals who have disabilities. Mentors are selected after submitting an application form and undergoing a review process, including reference checks. Protégés are participants in the DO-IT Scholars, Pals or Campers programs who are making plans for post-secondary education and employment. They all have disabilities (including visual, hearing, mobility and health impairments) as well as specific learning disabilities.

Most mentoring in DO-IT takes place on the Internet. Electronic communication eliminates the challenges imposed by time, distance and disability that are characteristic of in-person mentoring. For example, participants who have speech impairments or are deaf do not need special assistance to communicate via electronic mail. Those who cannot use the standard keyboard because of mobility impairments use adaptive technology to operate their computer systems.

DO-IT also facilitates communication in small groups through the use of electronic discussion lists. For example, one group includes both mentors and protégés who are blind. They discuss common interests and concerns such as independent living, speech and Braille output systems for computers and options for displaying mathematical expressions and images.

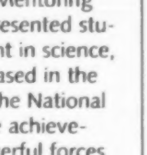
DO-IT's mentoring program has received national recognition with The Presidential Award for Excellence in Mentoring "for embodying excellence in mentoring underrepresented students and encouraging their significant achievement in science, mathematics, and engineering." It was also showcased in the President's Summit on Volunteerism and received the National Information Infrastructure Award "for those whose achievements demonstrate what is possible when the powerful forces of human creativity and technologies are combined."

Joining the DO-IT Mentoring Community

The DO-IT Scholars program, which includes multiple on-campus summer study programs and year-round mentoring, is funded by Washington state and is open to Washington residents. However, private foundations and corporate sponsors from other states can propose funding scholars from other states.

The DO-IT Pals electronic community is open to all teens with disabilities who are interested in pursuing college and have access to electronic mail. They communicate with DO-IT mentors, receive useful college and career information from DO-IT staff and make friends. For your teen to join DO-IT Pals, send electronic mail to doit@u.washington.edu and request a DO-IT Pals application.

Also visit http://www.washington.edu/doit/Programs/ for more information about these DO-IT programs.



Dr. Sheryl Burgstahler is the director of the DO-IT (Disabilities, Opportunities, Internetworking, and Technology) program. DO-IT is funded by the US Deptartment of Education, the state of Washington and many other organizations. DO-IT serves to empower young people with disabilities as they transition to college and careers through the use of computers, assistive technology and the Internet. "Tech Talk" is designed to address practical ways of integrating technology into educational, work and home environments. Dr. Burgstahler will also answer readers' questions through this column. Please send correspondence to: Dr. Burgstahler, University of Washington, Box 354842 Seattle, WA 98195; fax: (206) 221-4171; e-mail:sherylb@u.washington.edu.

continued from page 73

curiosity and build confidence by offering new ideas and opportunities that introduce protégés to advocating for themselves.

SUPPORT: Mentors encourage growth and achievement by providing an open and supportive environment.

DIRECTION: Mentors help protégés discover their talents and interests and devise strategies to attain their goals. One mentor explains, "I try to tell kids to listen to their hearts and think about what they really want to do… and go for it."

ROLE MODELS: Mentors accomplish many of these goals by letting their protégés know who they are. As one protégé shares, "I'm less shy now that I know there are more people out there that are just like me."

Mentors benefit from the mentoring experience as well. Protégés offer mentors:

CHALLENGES: Mentors develop their own personal styles for sharing their skills and knowledge via electronic communication.

NEW IDEAS: Mentors join an engaging community of talented students and professionals with a wide range of interests, abilities, and disabilities who are eager to share their own strategies for problem-solving and success.

FUN: Mentors share in the lives of motivated young people. Listening to them, hearing about their dreams and helping them along the road to success are just some of the fun activities!

Evidence of Impact

DO-IT has been studying the nature and value of electronic mentoring since 1993. Findings suggest that electronic mail can be used to initiate and sustain both peer-to-peer and

mentor-to-protégé relationships while alleviating barriers to traditional communications such as time and schedule limitations, physical distances and disabilities of participants. Both young people and mentors report positive experiences in using the Internet as a communication tool. The Internet gives young people support from peers and adults who are otherwise difficult to reach, connects them to a rich collection of resources and provides opportunities to learn and contribute. Many also report that people treat them equally because they are not immediately aware of their disabilities, an added value.

Joining a Mentoring Group

Many discussion lists, chat rooms and bulletin boards invite people with a common interest to join and share their experiences and ideas; some even offer mentoring relationships. But how do you know if one of these communities is appropriate and safe for your child? As with any other activity in which you seek to involve your children, find out about the organization sponsoring and supervising the activity. Most chat rooms, discussion lists and bulletin boards are not monitored or supervised. If you find a mentoring community that seems appropriate for your child, ask about how mentors are chosen and trained or guided. Also, ask what guidelines are given to the protégés.

Most important, before you allow your child to communicate with anyone on the Internet, talk with them. Set the rules for safe communication. Try keeping your Internet-connected computer in a busy place in the house and regularly monitor your child's use of the Internet. Child safety is an important consideration whenever children are using the Internet, a topic I will cover in next month's issue of EP.

Guidelines for Mentors and Protégés

To ease mentors into their new positions, the following are a few suggestions for new mentors:

- Get to know the protégés. What are their personal interests? Academic interests? Career interests?
- Introduce yourself to the group. Share your personal interests, hobbies, academic interests and career path.
- Explore interests with protégés by asking questions, promoting discussion and pointing to resources.
- Encourage participation in activities and try to attend activities when possible. Mentor-protégé relationships are strengthened through face-to-face contact.

Remember that developing meaningful relationships takes time. Give yourself and your protégés time to get to know one another.

Protégés should also remember that mentors are valuable resources to them. Relationships developed with mentors become channels for the passage of information, advice, opportunities, challenges and support with the ultimate goals of facilitating achievement and having fun. To get to know mentors and develop this relationship they are encouraged to:

- Introduce themselves and share their personal, academic and career interests and plans.
- Ask mentors about their hobbies, interests and experiences in academics and careers.
- Seek mentors' advice about college preparation, entrance and success. Ask about career options. Discuss disability-related accommodations and strategies. EP

IGNORANCE IS UNMASKED AND STEREOTYPES ARE EXPLORED

IN THIS SUMMER'S UNCONVENTIONAL ROMANCE,

Pumpkin

by Jennifer Kirby

After going through script after script looking for the perfect first project for her film production company, Blaspheme Films, actress Christina Ricci chose *Pumpkin* because of its strong message about preconceived notions, something both the special needs community and she herself have dealt with. In fact, the now 22-year-old star chose "blaspheme," (which is defined by Webster's New World Dictionary as, "to speak profanely of or to") as the name of her company because, Christina explains, "It comes from the fact that people decided that's what I was without knowing me. Just the idea that you take something that may appear in some way outwardly offensive and you think that it really is offensive all the way down to its core."

> **Just the idea that you take something that may appear in some way outwardly offensive and you think that it really is offensive all the way down to its core.**

Although the young star made her debut as Kate, the endearing younger sister of troubled and confused teen Charlotte in 1990's *Mermaids*, the Santa Monica, California native became equated with her dark and dangerous roles beginning with Wednesday in *The Addams Family*. While she admits to being interested in darkness and where it comes from, she has set out to prove that her range far exceeds that of the Goth actress everyone has labeled her to be, and to simultaneously send powerful messages about society. In *Pumpkin*, the star accomplishes both.

While Christina was originally interested only in co-producing the quirky art house film with Francis Ford Coppola's American Zoetrope production company, she was so taken by the script that she decided to go after it and ultimately landed the female lead as Carolyn McDuffy. "One of the things I liked so much about the script," Christina explains, "is that it was non-judgmental, though it was about two people normally judged so readily: a perfect sorority girl and a physically and mentally challenged boy."

And so, after dying her naturally dark hair blond, Ricci transformed herself into a wealthy sorority sister, whose upbringing and thus far "perfect" life has ingrained in her twisted ideas

Christina Ricci as Carolyn McDuffy and Hank Harris as "Pumpkin" Romanoff.

about the social standing of all others unlike her. However, it is when her sorority, Alpha Omega Pi, attempts to unseat its rivals, Tri Omega, from their 22-year hold on "Sorority of The Year" that Carolyn is forever changed.

Alpha Omega Pi plans to win over Southern California State University's Greek Council by not only extending invites to minority students, but also volunteering their time to assist athletes who have varying special needs and are training for the "Challenged Games" (Hollywood's version of the Special Olympics). Carolyn becomes squeamish over the notion of the latter and voices her opinion, but is immediately overruled.

Reluctantly accepting her assignment to help coach "Pumpkin" Romanoff, a good-looking discus thrower who has mental retardation and motor difficulties (played by Hank Harris), she is initially disgusted and afraid of her protege. However, it is not long before she sees him as the person he is, beyond his disability.

The relationship develops and, to the dismay of both her sorority and her chiseled tennis star beau, Carolyn falls in love with the innocent and sweet-natured athlete. Pumpkin in turn sees beyond Carolyn's appearance, and much to the shock and confusion of his mother, shows that he is capable of sexual feelings and love.

Christina, who is currently working on a yet-to-be-titled Woody Allen film, always looks for one element when it comes to scripts.

"I guess it sounds silly, but I think I take the parts I do because I want to make people aware of things. I wish that certain things were acceptable that aren't. A friend of mine, Kevin, is always saying to me, 'All right, Christina, you're not Nietzsche,' because I do get a little highfalutin with my beliefs," she explains. "But it boils down to the fact that I hate condemnation, and I hate when people who don't fully understand someone else say that they're wrong. So I want to play characters who initially make you go 'Ugh!' and then make you understand those characters, so that if you met someone like them, you wouldn't be so quick to judge them. I don't mean to sound self-righteous. I just hope that maybe I can teach people something from what I do."

According to the Alabama Pumpkin Association, it takes about 90-120 for a pumpkin to grow, days depending on both the variety and climate. With the way it makes fun of ignorance and stereotypes, dispels the idea of perfection and shows individuals who have special needs as productive, functioning human beings, Christina hopes that with *Pumpkin* she, her fellow cast members and filmmakers, have at the very least, planted some seeds of thought in the minds of critics and audiences alike. EP

Reluctantly accepting her assignment to help coach "Pumpkin" Romanoff, a good-looking discus thrower who has mental retardation and motor difficulties (played by Hank Harris), she is initially disgusted and afraid of her protégé.

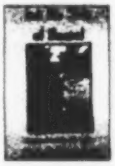
Beyond The Wall
Personal Experiences with Autism and Asperger
Stephen Shore

This book provides an interesting, well-written, and insightful autobiographical account of the life of a person with high-functioning autism/Asperger Syndrome. In a way that only one who has been there can, the author offers valuable information that will be of assistance to anyone coping with Asperger Syndrome.

AA1486AS $19.95



Just This Side of Normal
Glimpses into Life with Autism
Elizabeth King Gerlach

This mothers story captures the challenges of raising a child with autism. She can touch her son, Nicky, but not connect with him; hear but not understand his chanted phrases. Yet she embraces life-the joy and sorrow, hope and despair, frustrations and fear without flinching. This story testifies to the power of a heart that has broken wide open.

FL101AT $19.95

Pretending to be Normal
Living with Asperger's Syndrome
Liane Holiday Willey

This book peers under the umbrella of autism and looks at AS, a relatively new less debilitating autism-related diagnosis. Although first discovered in 1944, not much information has become available until the early 1990s with the establishment of a diagnostic criteria set forth by Gillberg and Gillberg. Here is shown that AS individuals are a bright thread in the tapestry of life and our civilization would be extremely dull and sterile if we did not have and treasure individuals with the condition.

E-Buddies

E-Buddies, the newest program within Best Buddies International, provides online friendships for people with and without mental retardation. The program pairs people based on similarities in age, interests, and gender, offers a safe way for people with disabilities to make friends and helps build communication and motor skills. E-Buddies, which began in October 1999, only requires that each participant be capable of communicating via computer and complete a screening process.

BEST BUDDIES®

For more information visit: http://www.ebudddies.org

WHO DO YOU THINK YOU'RE KIDDING?

Ziggy

The comic strip icon Ziggy has recently been named the official spokescharacter for the Leukemia & Lymphoma Society. Ziggy, the iconic "everyman" whose philosophical outlooks bring humor and hope to thousands of readers across the country, will exemplify the ideals of the Leukemia & Lymphoma Society, which gives a sense of optimism to thousands of people with blood-related cancers and their families.

Hugs and Hope

Hugs and Hope is a non-profit organization dedicated to bringing joy into the lives of critically ill or injured children. Based in Harshaw, WI, this foundation of more than 300 volunteers sends toys, cards, books, and stickers to sick children. To view stories, pictures, and prayers for the children, or find information about how to get involved or to send donations, visit their website, http://www.hugsandhope.com.

Anne Ford Scholarship

The National Center for Learning Disabilities has chosen Troy G. Sponaugle II of Fairfax, VA, as the inaugural Anne Ford Scholar. The Anne Ford Scholarship program provides $10,000 over four years to a promising high school senior with learning disabilities who plans to pursue a university degree. For more information, or to apply, visit http://www.LD.org.

Report to Congress

The 23rd Annual Report to Congress on Special Education released its results in June. Graduation rates for students with disabilities were higher and dropout rates fell over five percent since 1997. Integration of students with disabilities in regular classes was at a record level. The report also showed that students with autism had the lowest dropout rates, while students with emotional and behavioral disorders had the highest. To read the entire report, visit: www.edu.gov/offices/OSERS/OSEP/Products/OSEP2001AnlRpt.

Osgood-Schlatter on the Rise

As the participation of young girls in athletics increases, so does the occurrence of knee injuries previously seen mostly in boys. One such example is Osgood-Schlatter disease, an inflammation due to overuse that often occurs during a child's rapid growth period. Home treatment for the disease focuses on alleviating pain through typical first aid; decreased activity is advised. In many cases, Osgood-Schlatter disease may go away on its own if given enough time and rest.

Special Toys for Special Kids

Learning Express, a leading specialty toy retail franchise chain based in Ayer, MA, is developing a program to help its sales personnel assist parents of children with disabilities.

Led by its new president, Joe Diaz, the company is gathering information from a variety of sources to identify toys that can be easily used by children with special needs. "I hope to build on our record of service by being attuned to the special needs of children with disabilities," Diaz says. "By this fall, we intend to train every staff member in at least one toy or education category about the specific products that are especially useful to children with disabilities."

Learning Express is contacting organizations and publishers such as EP to provide the background and evaluation that will form the basis of this program. Founded in 1987, Learning Express currently has more than 130 stores operated by independent franchise owners in thirty-five states.

Visit http://www.learningexpress.com for more info.

Caregivers and Personal Assistants: How to Find, Hire and Manage the People Who Help You (Or Your Loved One!) 3rd Edition

By Alfred H. DeGraff, M.A., S.E.A.

EP Library Code: SA0612HC Price: $24.95

This new edition focuses on the RISHTMP cycle (Recruiting, Interviewing, Screening, Hiring, Training, Managing and Parting Ways) that occurs between caregivers and those receiving care, with the underlying theme that understanding everyone's goals will improve the quality of care.

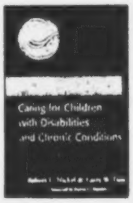
GETTING INVOLVED IN
CHOOSING STAFF

Getting Involved in Choosing Staff: A Resource Pack for Supporters, Trainers and Staff Working with People Who Have Developmental Disabilities

By Townsley, Howarth, LeGrys & Macadam

EP Library Code: HT6118HC Price: $55.00

Designed for professionals involved in hiring staff to support a group of people with developmental disabilities, this resource explains why and how persons with developmental disabilities can be involved in staff selection.



The Physicians Guide to Caring for Children with Disabilities and Chronic Conditions

By Robert E. Nickel & Larry W. Desch

EP Library Code: PB4463HC Price: $125

Opening chapters of this reference outline basic service needs, developmental screening and surveillance, working with families and the importance of nutrition and growth. Subsequent chapters cover specific medical conditions including developmental disabilities, mental retardation, cerebral palsy, autism, visual/hearing impairments, anxiety disorders, prenatal drug exposure, neural tube defects, craniofacial disorders, traumatic injury and chronic respiratory disorders.

Zooperb.

Kids love the Tigers, Turtles, and other creatures in this line of extraordinary therapeutic equipment. Distributed exclusively by Bodypoint Designs, Jenx™ has created a revolution in the evolution of children's positioning therapy.

Built with a unique tilting seat, Jenx Prone-angle™ sitters put your child in a more functional position, encouraging reaching and extending, helping them with upper extremity and head control.

Designed for children 9 months to 7 years, this new "species" of superb therapeutic equipment brings the support needed to their bodies, as well as a smile to their souls.

So, next time you need to position a child for success, introduce them to Jenx. Zooperb in every way.

JUSTINE

Justine Lydiana Rosario, 7, shared a lot of love with her baby brother **Jordan**, 1, this past Valentine's Day. Justine has hydrocephalus, a VA shunt, Dandy Walker malformation, facial hemangioma and is developmentally delayed. She lives in sunny Florida with her brother and parents, Gary and Nancy.

BRANDON

Brandon, 4, and his sister **Shirley, 11**, pose here with Santa Claus. Brandon had fetal distress when he was born. This resulted in cerebral palsy. He doesn't talk, crawl or sit, but is constantly a happy boy who is full of smiles. He loves to watch television, especially Blue's Clues and Barney, and also enjoys being read to by his mom and dad. Brandon attends Laremont School where he receives OT, PT and speech therapy. His favorite day is Wednesday, as that's his day in the pool for swimming therapy. Marie and Susan (his teachers) and riding the school bus are also among his favorite things. Brandon lives with his parents, Gladys and Donald, and his big sister Shirley. Shirley loves him a lot and plans to be a doctor to treat kids with cerebral palsy.

MATTIE

Pictured above are **Audrey** and her brother **Mattie Davis**, who has bilateral periventricular nodular herterotopia(BPNH) and a "patch" of polymicrogyria. Mattie, two and a half years old, enjoys reading books - especially Clifford, Barney, and Pooh - listening to all types of music, and using the "Jumpstart Baby" program on the computer. He attends the Summit (NJ) Speech School's EI Program where he is learning to take steps on his own. Mattie uses PEC cards to make choices and is now able to say "yes" by clapping his hands.

DEIONA

Deiona Nicole Jones, 3, has Down syndrome. However, this does not prevent her from being a "little princess" around the house. She has 3 older brothers, Aaron, Brandon and Cameron, and she attends the PEEP program (Program for Educating Exceptional Preschoolers), held at Lee Hall Elementary in Newport News, VA. Deiona lives with her parents, Valor and Anthony Jones, on Fort Eustis, VA.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (EXCEPTIONAL PARENT), 65 E. Route 4, River Edge, NJ 07661. (Please do not send "one-of-a-kinds" as we regret that **photos cannot be returned.**) On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

Record Keeping for the Medically Complex Child:

Having the Answers Ready

by Barbara Robbins

As primary caregivers, parents are an essential part of their children's healthcare team. No one knows them better than the person who loves them and takes care of their day-to-day needs. However, for the medically complex child, knowing and loving may not be enough in a crisis. When medical personnel ask parents for vital facts, a mistake or omission can have serious consequences, but the risk can be minimized by a method of record keeping I've found helpful with our son.

In July 1984, God blessed our family with a precious baby boy we named David. We soon realized that David was not developing normally, and at the age of three months he was hospitalized for neurological testing. While there he began having massive infantile spasms, a severe seizure disorder which resulted in profound mental retardation (see "Infantile Spasms," EP, September 2001). David was also diagnosed with cortical visual impairment, leaving him legally blind. We went home facing a frightening and uncertain future.

Pictured above is David Robbins whose rapidly changing condition inspired his mother to create the Medical History Notebook.

After three stressful months and many trips to the hospital, David's condition stabilized. As a family, we settled down into a routine. With frequent medical appointments, therapy sessions, daily home exercises, and several hours spent each day meeting David's needs, we had little free time.

As David grew, his condition became increasingly complex. When he was three years old he lost his ability to feed orally, and had surgery to put in a permanent feeding tube. Involuntary spasms in his muscles made David's joints rigid. Some of his joints became fixed with contractures and would not move at all. Gradually, muscle spasms resulted in curvature of his spine. David's fragile bones, weakened by lack of weight bearing, began fracturing. By the age of 8 David was in the hospital at least once a year.

X-rays when he was 12 years old showed that David's diaphragm was partially paralyzed. This resulted in breathing problems and the need for continual oxygen therapy, respiratory treatments and suctioning.

His rapidly changing condition opened my eyes to some gaps in my ability to be a useful member of David's healthcare team. Each time he went into the hospital, I faced a frustrating array of medical background forms whose completion was daunting. And I had trouble explaining some of David's rare medical conditions to the residents and nurses, because I didn't fully understand them myself. The need for some study and for a written record of David's medical history became obvious.

I began reading everything I could about David's special needs. I found one book extremely helpful: *Cerebral Palsy: A Complete Guide for Caregiving*, by Freeman Miller, MD and Steven J. Bachrach, MD (Johns Hopkins University Press, Baltimore, 1998). It provided a wealth of information that helped me to make sense of what was happening with David, and a section on hospitalization offered a guideline for compiling a brief record of a child's medical history. Starting with this guideline, I put together a loose-leaf notebook containing the basic information that was needed whenever David saw a new doctor or was admitted to the hospital. Though they were many, I believe the hours used assembling the original book were some of the most beneficial I've ever spent.

Through the years, I've updated David's medical history record periodically. By keeping it as a computer file, I can easily do this when his condition changes, medications change, or he is hospitalized, then print the new pages and add them to the notebook.

Thus I can quickly access the information needed to fill out hospital admitting forms. By now, staff in the emergency room and in the unit where

BEST COPY AVAILABLE

Almost every time David is hospitalized, at least one doctor or nurse tells me they wish all parents would keep such a notebook, because it makes their job much easier.

David is usually admitted often don't ask me to fill out forms. They simply ask for the notebook and make copies of the information they need for their records. Almost every time David is hospitalized, at least one doctor or nurse tells me they wish all parents would keep such a notebook, because it makes their job much easier.

The content of a medical history record will vary, depending on the needs of the child. Some of the basic data to include are listed below. Not all of the following areas may apply to your child, and others not discussed here may need to be included.

Title page: **Patient's name**
Social Security number
Insurance identification number

All immunizations, with dates. I've also included TB tests and results in this section. It can also help if reactions to any immunizations are noted.

Drug allergies and reactions. Include the name of the drug, specific allergic reaction, and (if available) the date of the reaction. I also list drugs to which David has had a reaction after prolonged use, in a separate list following the drug allergies. Though these are not considered actual allergies, this information can be useful. You may also find it helpful to include other allergies, such as latex, specific foods or adhesive tapes.

List all medical problems and diagnoses. I began with a primary diagnosis, then listed each of David's specific medical problems. Since I use this notebook with both medical and non-medical providers—teachers and school administrators, mental retardation professionals—I've included a brief explanation of each medical diagnosis. I also have included information on medications that have been

used in treating David's seizures, dates and details of fractures, and dates he's had pneumonia.

Routine medications. Necessary information includes dosage and frequency. If you want the hospital to follow your home medication schedule, times should also be included. Medications come in different strengths, so be sure to list the actual dosage. For example, phenobarbital, a common seizure medication, comes in 15 and 30 mg tablets and in two different liquid strengths. Noting merely "give one tablet twice a day" or "give 5 ml three times a day" can result in an incorrect dosage.

Medical treatments. Include the schedule of treatments, settings for any equipment used, descriptions of treatments (such as number of cycles, medications used, or supplies used) and any other related information. My son is tube-fed, so I've also included information about his feedings (date current feeding tube was put in, brand and size, feeding method, amount and kind of formula). For home use, an equipment maintenance schedule can also be helpful.

Doctors. Include the name, medical specialty, address, phone number, fax number, email address and cell-phone number. The same contact information is needed for the nurse, nurse practitioner, physician assistant and others in the doctor's office. If available, the date when you began seeing the doctor can also be helpful, along with the recommended frequency of visits and the date of the last visit.

Agencies and medical supply companies. Include school contact information, nursing or other healthcare agency information, social agencies, contact numbers for ordering supplies and medications, etc. Something I've found helpful for use at home is a list of standard supplies, upon which I can record the quantity of each item ordered, date ordered and date received.

Height and weight chart. This can be done as a list, or in the form of a graph.

Surgeries. Include the date, where performed, the name of the surgical procedure (eg, device implantation, selective dorsal rhizotomy), whether it was done as inpatient or outpatient, the doctor who did the surgery, and any other relevant information. Time spent in the hospital, for example, might be needed for reimbursement.

Hospitalizations other than surgeries. Include the dates of admission and discharge, where hospitalized, the admitting doctor, the reason for hospitalization, and any test results to which you need to refer.

Trips to the emergency room and even scheduled hospitalizations can cause great anxiety to the medically complex child and to the parents. In a stressful situation, it's natural to forget important information, but with a medically complex patient a mistake can be a matter of life and death. It is crucial to have accurate information about the person. A compact medical history record puts facts at your fingertips, ready to access whenever needed. EP

Get More Out of Vestibular Stimulation with The Motion Table

The Motion Table enables therapists to deliver the value of vestibular motion to their patients without the need for constant hands-on intervention.

Most stimulation equipment available today reduces the therapeutic effect of *horizontal motion* by incorporating rounding, swinging and tilting motions. **The Motion Table**, through its smooth, "vibra glide" movement provides a steady, uniform stimulation that can help "level out" extremes in patients' behavior.

And, since **The Motion Table** is motorized, patients can be stimulated for longer periods than is possible with manual equipment.

The Motion Table comes in several sizes and is available from RedBarn Enterprises, a leader in innovative solutions for therapists and their patients.

The Motion Table reduces...
- *Hypersensitivity*
- *Self-abuse*
- *Abnormal Muscle Tone*
- *Constipation*
- *Pulmonary Congestion*

The Motion Table increases...
- *Concentration*
- *Attentiveness*
- *Calmness*
- *Body Awareness*
- *Postural Control and Balance*

Try The Motion Table AT NO RISK for 30 days.
Try it for a month. If you're not completely satisfied, just send it back for a complete refund

For a copy of a just-released Technical Evaluation of The Motion Table or additional product information, call us at 1-800-577-1317, or visit us on the Worldwide Web at www.redbarn-enter.com.

Research Reflections....this time from abroad

Latest International Research on Intellectual Disability Bodes Well for Families

Her Excellency, Mary McAleese, President of Ireland (center) amid staff and self-advocates.

This article summarizes some of the exciting research presented at the International Association conference of the Scientific Study of Intellectual Disability (IASSID). The meeting was held in Dublin, Ireland, from June 12–15, 2002. As co-chair of the division presenting research on families, and one of the conference's Plenary Speakers, Dr. Jan Blacher had an inside view of some conference highlights.

This Inaugural Conference of IASSID Europe was held in order to promote scientific exchange and understanding throughout the many countries of Europe. Speakers came from 25 European countries, as well as from the U.S., Canada, Australia, Taiwan and Israel (considered "honorary" European nations for the purposes of this conference).

All in all, families who have a member with intellectual disability (ID) have many reasons to be hopeful about the immediate future. I'd like to begin by sharing some predictions with you from the organizers of this inaugural IASSID. I asked them, "How will parents of children and adults most benefit from the scientific study of intellectual disabilities?"

Dr. David Felce, Professor at the Welsh Centre for Learning Disabilities, University of Wales, listed multiple roles for parents in the conduct of research on ID. Parents may:

- suggest, or even decide, research priorities;
- learn from, or be consumers of, research findings;
- be directly involved in the conduct or process of research;
- interact with other members of IASSID to improve understanding and collaboration.

And from Dr. Patricia Walsh, Professor of Disability Studies at University College, Dublin:

"I've seen and assisted parents as they encounter the courts, lawyers, government ministers, service providers and the press here in Ireland for many years now. In each

Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, where she has been a researcher for 20 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of mental retardation, dual diagnosis and the transition to adulthood. Dr. Blacher has developed **Research Reflections** as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to **Research Reflections** and any suggestions you might have. Send e-mail to: jan.blacher@ucr.edu.

BEST COPY AVAILABLE

case, progress inches forward most surely when the initiators can draw on sound evidence – and that's what IASSID can deliver – at least on a good day."

At the meeting, I conducted interviews with several of the key figures, posing the main question: ***What are the most pressing research issues pertaining to intellectual disability, internationally speaking?*** There was some consensus among responses, centered around the implications of epidemiological trends and research in genetics, living environments and social integration.

Epidemiological trends. Dr. Chris Hatton, Research Director at Lancaster University in the United Kingdom, responded that epidemiological trends concerning people with ID are bringing new issues to the research forefront. He notes that across the U.S., Canada, Europe and Australia, ethnic and cultural diversity are increasing, and that it behooves researchers to conduct studies that are representative of, and applicable to, all persons with ID. Family researchers are taking steps in this direction, as reflected in the following papers given at the conference: *Child disability, parental coping and parental mental health in UK South Asian families with a child with severe intellectual disabilities* (Chris Hatton, Yasmeen Akram, Robina Shad, Janet Robertson, Eric Emerson, England); *Chinese immigrant families: Coping with developmental disability* (Iris Tan Mink, Kazuo Nihira, Eli Lieber, USA).

The paper presented by Chris Hatton and colleagues reported on data from a survey of 136 U.K. South Asian mothers of children with severe intellectual disabilities. They examined the prevalence of depression and anxiety in this group of mothers, and determined the applicability of current models of family functioning to South Asian families. Rates of parental anxiety (26 percent) and depression (40 percent) were considerably higher than those of South Asian adults in the U.K. who did not have children with disabilities. Anxious mothers were more likely to have a greater range of unmet service needs for the child with ID, and to lack full-time employment (for themselves or for their spouse). Depressed mothers were more anxious, as well, and received less social support, endured cognitive distraction, and experienced a lack of collaborative relationships with professionals. Together, findings suggested that family disadvantages in material, social

Laura Lee McIntyre, Conference Speaker (left) with Jan Blacher, Plenary Speaker and Chair, IASSID Special Interest Research Group on Families.

L to r: Jan Blacher, Stephen Healy, Secy. IASSID; David Felce, IASSID Europe; Ireland President McAleese and Neil Ross, President, IASSID.

and service supports are crucial factors in determining family functioning in South Asian families, who are a growing population in the UK.

Another epidemiological trend is that the life expectancy of persons with ID is rapidly increasing, and people with severe and challenging needs are often surviving into adulthood and even old age. Dr. Philip McCallion of the University of Albany noted that aging, dementia diagnosis and support of aging caregivers are now critical research issues. These areas were represented by such papers as: *Subjective burdens/ difficulties working with persons with intellectual disabilities and dementia* (Philip McCallion, USA, Mary McCarron, Ireland); *The needs of older people with learning disabilities and mental health difficulties* (Eleni Hatzidimitriadou, Rachel Forrester-Jones, England); *The challenges for supported living as people age and need more diverse support structures* (Margaret Rogers, Mairead Mitchell, N. Ireland).

Genetic research. Recent findings on genetics, in particular those from the Human Genome Project, may help to "explain" aspects of intellectual disability. Researchers who work with people with intellectual disabilities need to appraise and evaluate current genetic research and develop more sophisticated studies to investigate interactions between genetic influences (also called the behavioral phenotype) and the impact of the person's environment. Toward this end, Laura Lee McIntyre of the US presented a paper on *Behavioral disorders, syndrome specificity and family impact* (with Jan Blacher, USA). Findings were presented from 208 English-speaking and 115 Spanish-speaking mothers of young adults (ages 16-26 years) with severe disabilities. Although mothers in the two groups did not differ significantly in age (about 48 years), they differed in all other demographics reflecting social or economic class: employment, income, education, and health, with English-speaking mothers far more advantaged. Yet the percentages of young adults with low, moderate or severe behavioral challenges in the two samples did not differ. Young adults with high behavior problems, associated most strongly with autism, had the most negative impact on parenting. Young adults with Down syndrome were associated with the least negative impact. There were no differences in positive impact on parenting across these genetic subtypes. In addition, the impact of behavioral phenotypes (autism, Down syndrome, cerebral palsy, or other intellectual disabilities) on families was similar across cultural groups, except that Latina mothers reported more overall positive impact. This is the first attempt that we know of to show the effect of behavioral phenotypes across groups that differed widely in cultural context and socio-economic circumstances.

A Presidential Visit

A memorable event at the meeting was an address given by Her Excellency Mary McAleese, President of Ireland. She applauded the efforts of the international researchers assembled, and spoke of their role in putting Dublin on the map and consciences of researchers worldwide. Furthermore, she noted that Dublin would be hosting the Special Olympics in June, 2003, the first time Special Olympics would be held outside of the U.S. Readers of EP, particularly parents, might be pleased to know that Her Excellency emphasized the importance of research aimed at better understanding the experiences and needs of parents and families of persons with intellectual disability. Conference participants were surprised, and delighted, when the President mingled with the crowd after her address, and spent time conversing with some of the self-advocates in attendance. (Participants from the U.S. found this personal touch quite unusual.)

Other investigations of specific behavioral phenotypes and their impact included: *Behavior problems in girls with Rett syndrome* (Richard Hastings, England); *Family predictors of depressive symptoms among young people with Down syndrome* (Stephen Turner, Scotland, Alison Alborz, U.K., Vernon Gayle, Scotland).

Research on living environments. People with intellectual disabilities are living in very different environments from those of 30 or 40 years ago, a situation true in Europe as well as in the U.S. This raises new questions for researchers, of course, such as access to community health care for persons with ID, employment,

958 BEST COPY AVAILABLE

interactions with the legal system and self-determination. It will become more important than ever to identify which residential variables most predict higher quality of life for individuals with ID and their families. Determining quality and costs of residential care continues to be of interest, as reflected in the following papers: *Rational resourcing and productivity in community-based supported accommodation for people with intellectual disabilities* (David Felce, Edwin Jones, Kathy Lowe, Jonathan Perry, Clare Bowley, Wales); *The quality and costs of community-based group homes and village communities for people with intellectual disabilities in Ireland* (Patricia Noonan Walsh, Christine Linehan, J. Durkan, John Hillery, Ireland).

Social and integration issues. There is still much to be learned about social integration of people with ID and with other exceptionalities, and the European conference addressed this in a number of ways. For example, participatory research approaches, whereby the person with ID is an active agent in the research process, are becoming more popular. So, too, are action research approaches, where research is closely linked with local actions for positive change. Some exciting examples included: *Users views in the process of changing an organization* (Jos van Loon, The Netherlands); *Parents of kids with disabilities: How do they try to get more than an invitation to participate?*(Rita Stevens, Hilde Herssens, Belgium); *Self-advocates and research: A fruitful marriage?* (Erik Vriamont, Ludo Schoeter, Belgium).

I couldn't help leaving this gathering of international researchers without pondering the cliché, "small world." Perhaps, though, the world grows ever smaller because the capacities of those who inhabit the earth grow ever larger. So it went in Dublin, where innovative research findings from around the globe expanded our perspectives and knowledge of exceptionality. Wish you were there. ■

Part III: Transitions & The Placement Process - It's All About Choices

by Cynthia Whitfield

INFORMING

EMPOWERING

AND KEEPING PARENTS INVOLVED

While transitioning is rarely an easy process, it is something that most parents of children with disabilities must face. After working hard to find a placement that seems to fit their child's needs, parents are eventually faced with having to move on. Transition to a new program or to the next level of care could be necessary if, for example, the child's IEP doesn't change from year to year, the child stops moving forward or skills begin to regress, the child seems bored by school or the child resists getting on the bus in the morning.

Sometimes these changes are embraced by all involved. In other cases, parents report having the distinct feeling that their child's new teacher isn't exactly thrilled about having to include their special needs child. Sometimes a new placement seems like a step back rather than a step forward, and sometimes the necessary new program placement is not available. But at some point, moving on is unavoidable.

The Center for
DISCOVERY

Gigi Aaron, a consultant on autism, says a well-thought-out transition plan is essential. Besides facilitating placement, she advises teachers and assistants on the best ways to help children become happy and successful in their new settings. Whether the transition is from preschool to elementary school or from middle school to high school, Aaron has developed a system to help ease the adjustment period.

First, she observes children in their current environment and develops mini-profiles of their needs, strengths and challenges. Next, she prepares both child and new teacher for the move. "I have the prospective teacher come and observe and meet the child in his or her environment," says Aaron. "I might tell the child a social story about things that happen at his new school."

Aaron usually suggests that children first visit the new classroom after school hours, when the room is quiet and they can explore it without distraction. Then she plans a visit during school hours. Sometimes Aaron compiles a book with photographs taken at the new school, featuring the child on the stairs, in the classroom and in the cafeteria. And depending on the child's level of understanding, she sometimes gives the new school the big build up. "I talk to them about being big kids and being ready to go to this great school," she says.

"Children at high risk of having a great deal of difficulty adjusting to a new placement might need to be very slowly and gradually integrated into the school," says Aaron. She has occasionally advised temporarily setting up a child in an extra classroom, and then very gradual inclusion into school activities.

The unhappiest of all transitions comes because of physical or verbal abuse in a classroom or treatment center. "It doesn't happen often, but I've seen teachers who were abusive, and I've reported them," says Aaron.

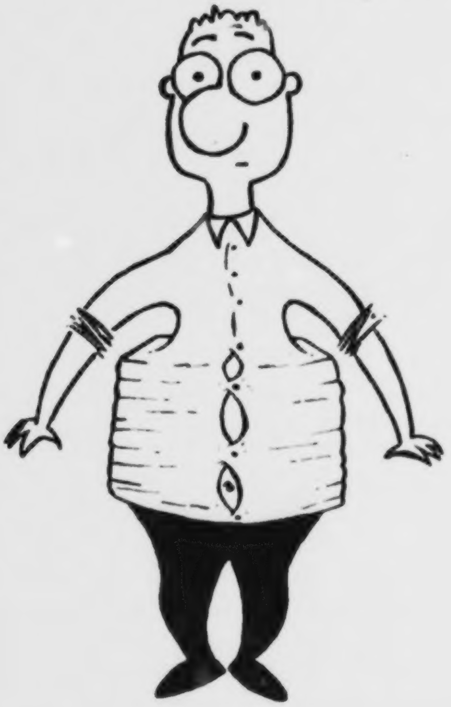
As our volunteer clearly demonstrates, 21* pediatric medical journals can be quite difficult to digest.



In fact, unless you have a medical degree we wouldn't recommend it.

If you have an interest in the latest breakthroughs and research published in pediatric journals, but don't have the medical training required to easily digest the information, there is an alternative.

ChildHealthMonitor.org publishes articles adapted from the latest monthly issue of each of the world's leading pediatric publications*. The information is the same. The difference is that much of the medical jargon is replaced with everyday language. It's also online which means that anyone with an Internet connection can now have instant access to reliable, useful information on the latest advances in treatment, prevention, and caring for kids.

Simply, visit **www.childhealthmonitor.org** and you too can have unlimited access to hundreds of simply written articles on up-to-the-minute pediatric discoveries.

We think you'll find this option much more palatable. (Our volunteer did.)

* Acta Paediatrica, Archives of Disease in Childhood, Archives of Pediatrics and Adolescent Medicine, Brain and Development, British Medical Journal, Child: Health, Care and Development, Developmental Medicine and Child Neurology, European Journal of Pediatrics, Journal of Adolescent Health, Journal of Child Psychology and Psychiatry, Journal of Paediatrics and Child Health, Journal of Pediatric Psychology, Journal of Pediatric Surgery, Journal of Pediatrics, Journal of the American Academy of Child and Adolescent Psychiatry, Journal of the American Medical Association, The Lancet, New England Journal of Medicine, Pediatric Infectious Diseases Journal, Pediatrics, and Research in Developmental Disabilities

In some cases parents aren't satisfied with any of the options available to them and decide to home school their children. Conversely, some parents come to the decision that residential treatment is in the best interest of their child.

Residential treatment is often considered when a child, with or without behavior problems, has multiple disabilities difficult to address adequately in a day-school setting. "A few parents choose residential treatment after their children become dangerously aggressive and destructive," says Aaron. Their child is no longer learning or making progress in school. "In the end, some kids are more successful when they have the full-time services they need for educational, recreational, behavioral and medical support. Controls available in residential treatment, along with constant evaluation, help the child learn," Aaron says.

> **One hard thing for parents when children leave early intervention is that the emphasis is no longer on the family, but only on the child. There's the change from the IFSP to IEP (Individualized Education Plan).**

Transition teams consisting of educational and medical specialists now realize that integration with regular education students just isn't feasible in every situation, says Tammy Walkup, a speech-language pathologist and member of an Oregon school district transition team. "We now have two specialized classrooms for children with autism. We've had to agree that sometimes these children make better progress being taught by people specializing in certain techniques, such as applied behavior analysis (ABA). And the kids are making progress."

Walkup's transition team functions similarly to one she worked for in Nebraska. The team includes Walkup, an occupational therapist, school psychologist, a nurse and other specialists, depending on each child's disability.

"We conduct evaluations for children who are three to four years old to determine whether they're eligible for special education. Then we come in later when it's time to transition from preschool to elementary school. A year before kids transfer to elementary school, we start talking about the upcoming transition. We make sure the parents know what the steps will be. We have a meeting at the winter Individualized Family Service Program (IFSP) review, and parents receive a transition manual outlining the entire process. The team suggests possible sites, and the parent, along with someone from the team, visits the various classrooms."

Typical alternatives for children with cognitive disabilities, for example, include regional learning centers, life skills or special education classrooms, and part- or full-time integration in a regular classroom. Sometimes these alternatives are not adequate and special non-public schools in residential programs must be considered.

"The team makes a recommendation and we iron out any differences of opinion with parents and other members of the team," explains Walkup. "One hard thing for parents when children leave early intervention is that the emphasis is no longer on the family, but only on the child. There's the change from the IFSP to IEP (Individualized Education Plan). Also, their children were usually involved in primarily play-based activities, and now the focus is far more academic."

Walkup admits that the transition process is sometimes a struggle, but estimates only about ten percent of parents have serious disagreements with the team on placement, and that just a few of these proceed into due process and mediation. "It's been my experience that our team is seen in a positive light, and I'm very proud of that," she states.

My 8-year-old son Jalen, diagnosed with autism and mental retardation, has already journeyed through a variety of transitions. After he was first identified at age two as developmentally delayed, services consisted of a monthly visit from an early intervention case manager. She came over to play with Jalen and suggest techniques to help him develop his language and fine motor skills.

The easygoing nature of intervention changed drastically when Jalen turned three and officially became "preschool age." He was formally diagnosed with autism and retardation. The case manager insisted that he needed to be in a community preschool, so one was found and an aide was assigned to him. But it was clear that he didn't relate to the other children, and the teachers were finding it difficult to include him successfully despite consultations with the case manager. Jalen responded well to his aide, though, and I proposed he start a home-based program.

After much resistance, the idea was approved and preschool was brought home to Jalen. Aides spent three hours with him each day, implementing the individualized program his case manager and I designed. He also received speech therapy and occupational therapy services at home.

After a year and a half with the home program, I felt he was ready to transition to a local specialized preschool comprised of both typically developing children and children with austism. At first, adjustment was difficult, and I was severely shaken each morning as I dragged him, kicking and screaming, onto the bus. Once at school, he cried and refused to join circle time and various other activities. But with the help of a patient teacher, he calmed down in a matter of weeks and started to enjoy his new class.

Two years later a new applied behavior analysis (ABA) classroom for kids with autism opened, the only public institution of its kind in the area. The timing was perfect; it was just as Jalen was leaving the preschool program. Jalen was lucky enough to be one of the kids recommended for the program. It was a half-day program with ten children, one teacher, and ten assistants, to allow lots of one-on-one as well as group activities.

The children were to go to their neighborhood schools in the afternoon. Jalen was assigned to an afternoon life skills classroom housed in an elementary school across town because he wasn't able to understand basic kindergarten academics. There he was sometimes mainstreamed for phys ed, recess and other activities.

Initially, Jalen learned a lot from the ABA program. However, the long bus rides, high teacher turnover rate and other problems eventually made this placement unsatisfactory. Recently I suggested that he stop attending the morning class altogether and attend the special education classroom full-time. That is his placement now, and it seems to be working well.

Unfortunately, Laura Yoder did not experience such a seamless transition. Her son Matthew, six and a half years old, has Down syndrome, and Laura recites a litany of frustrations in getting what she considers an appropriate education for him. She points to her son's preschool class as the first link in a broken chain that led to problems when it was time to transition to public school. "I felt that they didn't deal with his refusal behaviors well," says Laura. "They let him get away with not working as hard as he could, so he didn't develop to his full capacity during that crucial time. That, in turn, affected his options when it was time to transition to kindergarten."

"During the entire transition process I felt overwhelmed, powerless, confused, and inadequate as my son's advocate," Laura said. She also felt that the time and energy spent advocating for her son took away from the time she spent with him.

Laura, a former public school music teacher, was familiar with the school environment and savvy about various programs offered. She decided against a particular life skills classroom because several students there had severe behavior problems, and she feared they would be negative role models for her son. She was offered an "extended resource" classroom for children who need lots of academic support, an academic step above the life skills program. But that placement didn't seem to fit either.

Laura describes working with Matthew's IEP team as particularly challenging, and this impression was later confirmed by a professional advocate. "The people on the team were nice, but when it came to my son's academics we could not work together." After doing her own research, she asked that he be included in several programs that the team decided against. "After the advocate started coming to meetings with me, she agreed the team was unusually resistant to compromise," says Laura.

"During the entire transition process I felt overwhelmed, powerless, confused, and inadequate as my son's advocate," Laura said. She also felt that the time and energy spent advocating for her son took away from the time she spent with him. She struggled with feelings of anger and disappointment, of betrayal, and of not being understood. "I felt they had no faith in Matthew's abilities, and that my input was disregarded. The experts think they're right, but parents know their children more than anyone else." Finally, against her better judgment, Laura agreed to another life skills classroom in the afternoon following mainstreamed morning kindergarten with an aide. She experienced much difficulty with the life skills teacher. "We just didn't agree," she says.

She requested an out-of-district transfer to a nearby city, and is still waiting for a final decision. In the meantime, Laura decided to hire a

continued on page 100

continued from page 99

tutor for her son using direct instruction. "He's doing well now," she reports. She feels he's moving in the right direction at last. To help with this process, Laura recommends the book, "The Complete IEP Guide: How to Advocate for Your Special Education Child" (available from the EP Library, http://www.eplibrary.com).

Sometimes a transition to the right placement is a positive, life-changing experience for the entire family. Mary Jo Reich and her husband David, both New Jersey attorneys, have found the road to appropriate services far easier than expected.

Their son Scott, now 13, has a metabolic disorder called Mucolipidosis IV, or MLA for short. "It's extremely rare. It's in the same family of such Jewish metabolic storage diseases as Tay-Sachs, but children don't die from it. Instead, they have profound disabilities," she explains. Scott cannot walk or talk, and has severely impaired vision.

"He understands and communicates with modified sign language, waves and says 'Mama'," Mary Jo says proudly. "He also loves to go to restaurants—he shows he wants to go by waving bye-bye and making the sign for eat. He also loves music and poetry; blasting Bruce Springstein in his CD player always makes him laugh."

But two years ago, Scott wasn't so happy. "He was growing out of his old school," says Mary Jo. "It was a good school, but they couldn't really help him any longer. He wasn't progressing, and he was no longer happy there. Everyone agreed he needed a change."

So it was back to the IEP team and on with the search for a new placement. After visiting all the recommended schools, the couple felt there were no safe, certified schools for children in New Jersey with multiple disabilities, cognitive deficits and visual impairments.

Then Mary Jo and Dave discovered New York's Center for Discovery in Harris, NY. Friends had placed their own child at this residential school and were very happy with it. The Reichs visited and were immediately impressed. "It is such a beautiful place, and the people there are wonderful. We were just blown away," raves Mary Jo.

However, getting approval for Scott to attend the school was complicated because the school had never admitted an out-of-state student and wasn't certified in New Jersey. The school submitted the proper paperwork with the Reichs' help, and it was soon certified by the Department of Education and other agencies in New Jersey.

continued from page 100

While mulling over the decision to enroll him at Center for Discovery, the Reichs talked to another couple who'd recently enrolled their own son, a boy in his late teens. "We asked them if they had any regrets and they said their only regret was that they didn't enroll him sooner, because his life was better there."

Convincing the IEP team and the school district to approve the placement and foot the bill was surprisingly easy, says Mary Jo. "They told us they wanted what was best for Scott and after visiting, they agreed that the Center for Discovery was best. There are only eighty children with Scott's disease in the world, and ten of them reside at Center for Discovery."

"It's been my experience that it doesn't help to approach the schools as if they're your enemy," Mary Jo notes. "Early after Scott's diagnosis, I went to meetings for parents of children with special needs and there was a lot of emphasis on demanding what you wanted for your child. But later I found that the people in the field are caring, reasonable people who can't be described as the enemy."

At the Center for Discovery, students receive speech, physical and occupational therapy, and enjoy a therapeutic pool, horseback riding, music, animals and nature. Scott lives in a brand new house for out-of-state children and visits the other children's houses for various activities, goes out on field trips and socializes extensively. During the winter, the Reichs drive nearly two hours to visit him at the center. During the warmer months, they bring him home for weekends and vacations.

"It's just an amazing place. Scott loves it. When we go there and he sees us, he doesn't burst into tears like he did those last years at the old school. He used to cry because he was anticipating us leaving again. Now he gives us a hug and kiss and is happy to see us, but he's also happy to come back to the center," says Mary Jo. "Everyone there is well-trained, and he works with therapists all the time. There is 24-hour coverage. There's always guidance, education and supervision. This is the least restrictive setting for Scott. This is where he needs to be. We feel very, very lucky."

Another major transition occurs when children leave high school and enter the world of adults. Outside of the comfortable nest of public school services, parents and young adult children may find themselves bewildered — and without the support they need.

In accordance with IDEA, transition plans for adulthood and a life after school are mandated to begin when a child is fourteen. Students are typically taught self-management skills such as money management, cooking and laundry. By sixteen, future plans should be narrowed down.

There are myriad avenues of possible support, such as community-based waged work, vocational rehabilitation, sheltered work programs, social security benefits and public assistance funding. But accessing these supports is sometimes difficult; parents may need the assistance of an advocate or a case manager.

Some former special education students require only minimal support to live on their own, such as visits from caseworkers to help with specialized tasks. Others stay at home with their parents. Many states are beginning to develop support programs, such as respite care and recreational opportunities, for adult children living with their parents. Many communities have group homes for adult children with extensive needs whose families want to place their child outside the home, but may face long waiting lists for placements. Experts suggest getting children's names on group home waiting lists years before they leave high school, and helping their children set realistic goals for the future.

Jeffrey and Eva Kittay's daughter Sesha was 32 when she enrolled at the Center for Discovery's adult residential program three years ago. Sesha has multiple disabilities including profound retardation, cerebral palsy and scoliosis, and is semi-ambulatory. Although the Kittays did some searching for an appropriate placement when she aged out of public school services at age 21, they were disappointed in the quality of services they found. For a while she attended a day program but "not much attention was paid to the kids, and we kept her more and more at home," says Jeffrey.

Finally Sesha left the day program altogether and the Kittays hired therapists and aides to care for her at home. They found the Center for Discovery "none too soon" says Jeffrey, as it was becoming harder to care for Sesha at home, particularly after a long-term caregiver needed to retire. "She's much happier now. She's becoming stimulated and has friends. She's enjoying all the people around her."

Ultimately, the success of parents and the success of school programs must rest on programs' abilities to move children and young people toward maximizing their potential. There are no "do-overs" because at 21 entitlement to an appropriate educational program ends. Finding the program that will best serve your child and making the necessary transition is essential at each level of education. EP

Cynthia Whitfield is a free-lance writer with four children. She has written articles for her local newspaper, for an advocacy newsletter for people with disabilities and for a career exploration magazine. She spends most of her time at home writing, running a home-based preschool and homeschooling her son Logan, who has autism.

Parents Criticize Special Ed in Schools

According to a recent survey of parental opinion, many parents of special needs children believe that personnel are qualified to deal with their children, but school systems do not offer special help unless parents insist.

The Public Agenda poll of 510 parents of children in special education also found:

- 1 in 6 parents have sued or threatened to sue their child's school district to get proper services
- 55% of parents must research themselves to find what help is available to them
- 45% say their child's school program doesn't adequately prepare students for the real world, and
- 35% become frustrated when it comes to finding the services they need.

For information on Public Agenda or a copy of the survey, visit their web site at http://www.publicagenda.org.

THE GUN LAKE ADVENTURE SERIES

The Barn at Gun Lake
Mystery Explosion!
Blackbird Island
Noonday Trail

The Gun Lake Adventure Series, by author Johnnie Tuitel, depicts the life and adventures of twelve-year-old Johnnie Jacobson. Jacobson, who has cerebral palsy, leads his friends on several mystery-solving adventures from his wheelchair. The main character is based on Tuitel's own experiences growing up with cerebral palsy. The adventure series includes The Barn at Gun Lake, Mystery Explosion, Black Bird Island, and Noonday Trial. These four books are great examples in teaching children how to overcome adversity. The Gun Lake Adventure Series can also assist parents and teachers in opening up discussions on diversity and how to treat people with disabilities.

Cedar Tree Publishing, 2455 Norcrest Drive, Norton Shores, MI 49441-4450, 888-302-7463

Our Little Angel

by Alycia and Gina Crilly

Our little sister Mary is three years old and has a rare genetic disorder called Joubert syndrome. She has a tracheostomy and is ventilator-dependent. She cannot walk, talk or eat by herself. Her liver disorder also makes it hard for her to function. Despite these problems, Mary is the happiest person we know.

Even though Mary has all these difficulties, she has managed to come a long way. By the use of switches, Mary can tell us things. She has also learned a few commands. If you put a stick in her hand and say, "Mary, show stick," she will proudly raise it up to you with a huge smile on her face. If you ask her "Where's your feet?" she raises her feet into the air, waiting for our response. She will gladly give you a high five, and will give you a lovable hug if you ask for it.

Mary is an extremely happy child. Almost every day, we make sure she goes on her walk. Whether to a park or just around the neighborhood, Mary simply enjoys relaxing and being with her family. She has also shown interest in particular things. For example, the folk singer Raffi is one of her favorites. His songs calm her when she is having a bad day and always leave a smile on her face. She has all of his CDs, some books, videotapes and even a shirt! In addition to Raffi, Mary is interested in books, music, light up toys, balloons and glow sticks. Her unique personality is loved by everybody who meets her.

We are so proud of our little sister and enjoy her every day. We are never embarrassed by her and answer all questions that others may ask about her disability. When we feel blue, we like to be near her. Seeing that we feel down, Mary gives us a huge smile from ear to ear. Her brilliant blue eyes sparkle when she looks at you and her charming personality is bound to cheer up anybody's day.

We believe that Mary teaches people to appreciate every day and to enjoy the simple things in life. We have no doubt in our minds that Mary was put on earth for a very special reason. People notice that despite her disabilities, she is one of the happiest children around. We were blessed with an angel who was touched by God. EP

Submit your Children's Page to: EP, ATTN: CHILDREN'S PAGE, 65 East Route 4, River Edge, NJ 07661. A Better Bedtime Story

The Vail Enclosed Bed

Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt. Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

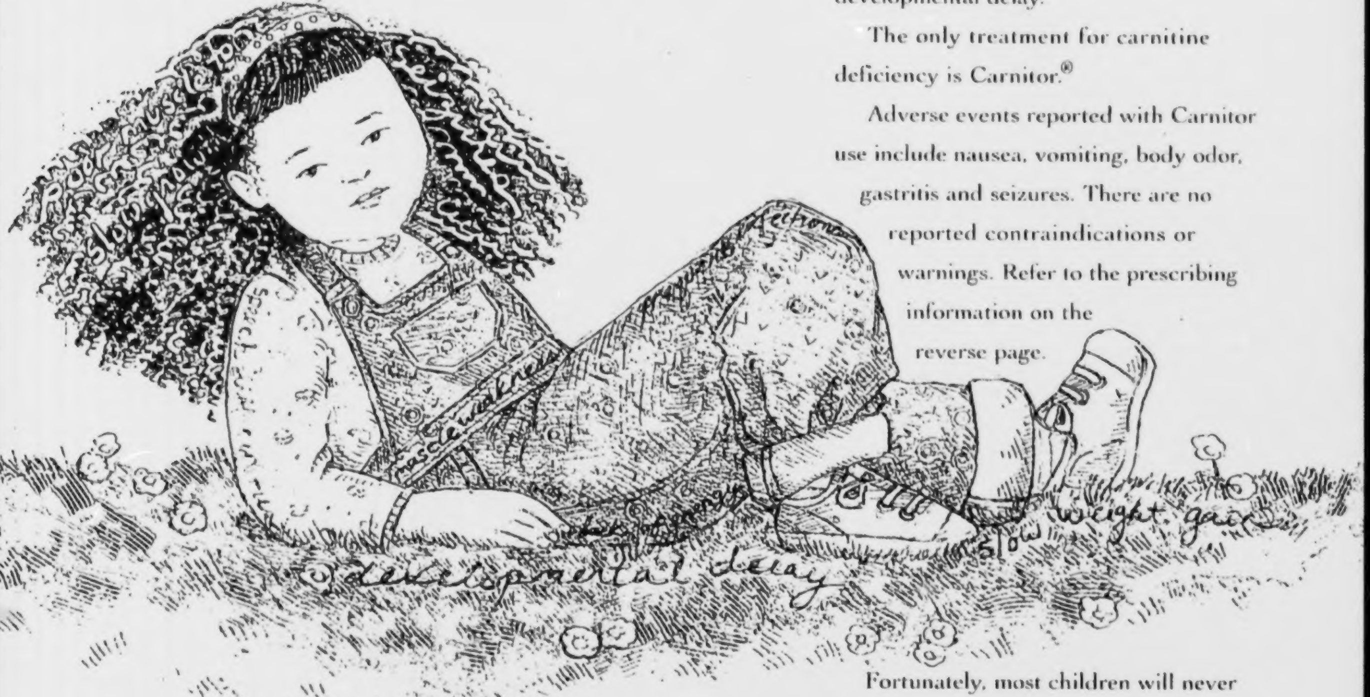
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

CARNITOR®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

The Center for DISCOVERY

The Center for Discovery is certified by New York State through the State Education Department, the Department of Health and the Office of Mental Retardation and Developmental Disabilities (OMRDD); and by the Commission on Accreditation of Rehabilitation Facilities (carf).

Visit us at Booth #730 at The World Congress & Exposition on Disabilities in Orlando, Florida — October 3-5, 2002

Please read the four-part series, "Transitions: Informing, Empowering and Keeping Parents Involved," (June through September) currently appearing in Exceptional Parent Magazine.

Don't miss the special presentation, "Transitions: Informing, Empowering and Keeping Parents Involved," at the WCD (Oct. 4, at 2:00 p.m.) that will address the issues raised in the four-part EP series.

Be sure to attend the presentation at the WCD (Oct. 3, at 3-5 p.m.) highlighting the outcomes of The Center for Discovery 's International Summit, entitled "Disabilities: Sharing Visions for the Future" that was held at The Center this past June.

The Center for Discovery, a nationally-renowned prep school for children with significant disabilities (including multiple disabilities, medical frailties and some behavioral concerns) recently opened several new, small, universally-designed residences.

Located near Monticello, NY in the picturesque Catskill Mountains, just two hours northwest of New York City, The Center features a nature-based program that challenges children, and their families, to work with us to provide the finest educational, clinical, social and residential opportunities available anywhere.

We may just be the right program for your child.

Call our Admissions Office at (845) 794-1400, extension 1444 for information and/or to arrange a personal tour and see *discovery* in action.

For subscription and advertising information, see page 106

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

Kelly Bankston ◦ 1981- 2002

You might say I had a "thing" for Kelly Bankston

Although I'm formally trained as a physician, I wasn't Kelly's clinician. My relationship with her was perhaps more natural, more flowing, more mainstream and more comfortable—I was simply her friend.

The sign on the building that houses my office announces to everyone that it's a "habilitation center," and despite the hordes of mail that is addressed to me care of the "rehabilitation" center it's clearly a habilitation center. It's where Kelly liked to hang out when she took her jaunts out of her classroom.

The word "habilitation" comes from the Latin "habilis," meaning to make suitable or to make fit. That is the nature of what we try to do. Rehabilitation, as you might know, is the retraining of skills in people who had them and lost them from degenerative disease, cerebral insults, trauma or accidents. Our folks, including Kelly, never had these skills to begin with—and so the term "habilitation" better defines our goals, our efforts and our hoped-for outcomes. But that certainly is not to imply that Kelly didn't have skills. She had the innate skills to engage people, make friends, challenge people, question their murky beliefs and, with me specifically, to get anything she wanted.

I came to Chattanooga eight years ago and like most physicians had no formal training in developmental disabilities. Most of what I have learned I learned by the seat of my pants—I learned from the parents, my colleagues, and, most dramatically, from Kelly and her classmates. They taught me to abandon my preconceived notions about learning, about abilities, about never ceasing to be amazed.

Mostly they taught me about citizens with special needs, the politically correct term to define people with disabilities. Kelly provided the answer to the age-old question: what's so special about special needs? The answer is "nothing." Kelly's needs, like those of her classmates, like those of you and me, were to be understood, to be considered, to be connected, to be loved, to be authenticated, to be respected and mostly to be needed—the same shared, not special, needs that give my own life meaning and a reason to get up every morning.

She left me with two things – one tangible and the other an image.

She left me a ream of paper with her phone number. At first pigeon scrawls, mostly illegible, more like ancient hieroglyphics or cave wall scratches, and then finally clearly defined, legible letters that began 622—more like the number of hours Kelly and her teacher, Jenny Chase, worked together to transform the pigeon scrawls into ordered, disciplined, controlled and purposeful writing.

By Kelly asking me daily if I had her number, she was announcing to me that we were connected—and she was doing her part to invite me into her inner sanctum of acceptance, friendship and love.

The image she left me is that of her "thumbs up salute" when I would ask her, "How you doing, Kelly?" She reminded me of the images of the young British Royal Air Force pilots giving their thumbs up salute when their Spitfires roared to life and were ready for take-off. Kelly was always ready for take-off, and always ready to take to the skies or the hallways in search of a new adventure, a new encounter or a new experience.

I owe Kelly quite a lot professionally. She and I graced the cover of the August 1995 issue of Exceptional Parent Magazine because of a program we co-developed, designed to teach both new and seasoned doctors the joys and challenges of caring for children and adults with developmental disabilities and shared needs. (By the way, this is the first time the term "special needs" has been replaced by "shared needs", a habit I will try to adhere to from this day on.) The article led to my invitation to join the magazine's Editorial Advisory Board and eventually to become the editor-in-chief. Quite the coup for an upstart in the field.

Kelly—on her first outing as a trained patient simulator at Grand Rounds at Chattanooga's Erlanger Hospital—gave a fumbling intern a lesson which I'm sure will guide her for the rest of her medical career. The intern was invited to come up to the podium and examine Kelly's distinct bony contracture. In front of colleagues, residents, attending physicians, department heads and professors she began to examine Kelly. After several tense moments, Kelly announced to the audience that she thought if the intern removed Kelly's bulky ski parka, the intern might have a better chance of feeling her deformity. I'm sure to this day, if she decided to pursue her profession, that young doctor never examined a patient without removing her jacket. Kelly indeed left her mark on medicine.

Another project that Kelly adopted with élan and enthusiasm was "Kelly's Random Acts of Kindness Cart." (Editor's Desk, EP, January 2002). Kelly and her assistant Anne Patten would patrol the halls at Orange Grove and randomly present gifts to teachers, assistants, therapists, nurses and bewildered visitors simply because she enjoyed the feeling of giving something to someone for no apparent reason.

The cart has been restocked and we're conducting a search to find someone to carry on the tradition that Kelly started and perfected.

Kelly is memorialized here in the pages of Exceptional Parent

BEST COPY AVAILABLE

Magazine and will remain in my heart long after the pages are yellowed, brittle and faded.

"We are spirits. That bodies should be lent us while they afford us pleasure, assist us in acquiring knowledge or in doing good to our fellow creatures, is a kind of benevolent act of God. When they become unfit for these purposes and afford us pain instead of pleasure, instead of an aid become an encumbrance and answer none of these intentions for which they were given, it is equally kind and benevolent that a way is provided by which we get rid of them. Death is that way."

As soon as I find your new area code Kelly I will call you… after all, I do have your number.

Rick Rader, MD, Editor-in-Chief, EP
Director, Morton J. Kent Habilitation Center
Orange Grove Center, Inc.,
Simply Kelly's friend

I've just returned to my office after attending Kelly's service. I smiled and laughed more than I cried. As Kelly's life and personality were reflected by clergy and friends, I, too, took a moment to think about what Kelly meant to me. As I remember, I will think about her visits, usually daily, to my office as she headed to check the classroom mailbox. Kelly, proudly a classroom helper, was sent on a mission and she took that mission very seriously. This was a young lady who could drive her powerchair more efficiently than some drivers on the open road. I was always amazed at her ability to "turn on a dime."

Kelly chatted with me about her family, her friends, her teacher, Jennie, and classroom assistants, Carol and Caroline. Kelly loved people and life—and it was so obvious, while listening to the words spoken at her service: people and life enjoyed Kelly. Heaven, look out! Your new resident is quite a special lady!

Jann Davis, Social Worker, Children's Services

Kelly Bankston was an extraordinary young lady. I have known her since the day she was born. A paragraph isn't enough to express my feelings for Kelly. She would stop by my office almost every day on her way to get the mail. Sometimes she would just wave and keep going; other days she would stop and visit for a little while. I could always count on Kelly to make me laugh. She touched so many people in her 21 years, and I will miss her greatly.

Nina Rains, Technical Support Assistant
Orange Grove Center, Inc.

As a volunteer at Orange Grove Center, I have known Kelly for almost 10 years – about half of her young life. To know Kelly is to love her; I'm no exception to that premise. I sat sadly this week at her funeral service listening to several eulogies appropriately and eloquently expounding on Kelly's virtues and personality. I heard a host of descriptive words and phrases such as cheerful, always smiling, caring, loving, can wrap you around her little finger, etc. I thought how true these accolades were. I marveled at how someone so young could amass such success in influencing the people she met. Then the thought came to me: Kelly is more than a person, she is an illuminating spirit. The twinkle in her eye, the smile on her face, the hugs she gave freely, the thumbs up she gave even when things were not going well and many other indefinable qualities gave those who met Kelly, no matter how fleetingly, a feeling of peace and caring. The world is a little sadder for Kelly not being here, but a lot brighter for her having touched the lives of so many.

No discussion about Kelly would be complete without recognition of her dedicated father, Mark. The two were as one. His untiring devotion and loving care are an inspiration to all fathers and caregivers.

Jim Goldman, Orange Grove Center
Volunteer and Board Member

There are so many "Kelly stories," but my favorite is when my mother and I gave Kelly's classroom a surprise Christmas party. My brother played Santa Claus, and every few minutes Kelly could be heard saying "Uncle Charlie." Staying in character, my brother would tell her, "I'm not Uncle Charlie, I am Santa Claus." Kelly let him have his way and at the end of the party she yelled out, "Santa Claus, when you get home, tell Uncle Tommy to call me!"

Rest in peace my darling angel, momma loves you.

Cindy Bankston, Kelly's Mother EP

Search & Respond

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S Looking for Advice with attached Chromosomes

My daughter was diagnosed with Chromosome 5 attached to Chromosome 15. The doctors still have not determined what effect this will have on her. She was born with a cleft palate, long and slender fingers, small ears with a fold on top and small facial features. We have been told that she does not have club feet but that they are shaped as if the tops of her bones are overlapping. She has slight hearing loss due to her ear canals being too small. She does not seem to have any cognitive delays, although the doctor says that it is hard to tell with her being so small. Can anyone whose children have similar symptoms offer advice?

—KS, via EP Web Site

S Short Gut Syndrome

I am looking for information on Short Gut Syndrome. I am the prospective adoptive parent of a three-year-old who has never eaten by mouth and I am hoping that she will. I would greatly appreciate parents sharing their experiences of helping their children convert from enteral tube feeding to oral feeding.

—CH via EP Web Site

S Seizure questions

My one-year-old son has lissencephaly and seizures called infantile spasms. Now that he is getting older, the doctors are calling the seizures by some other name. Does anyone else have experience with this?

—A, via EP Web Site

S Looking for diagnosis

We have a beautiful 16-month-old daughter who was born at 36 weeks measuring 18 inches and 6.9 pounds. At present she is 27 inches and 16 pounds. She has been diagnosed with "failure to thrive" because she does not eat enough on her own (even though her suck is strong enough) and has delayed gross motor skills. In prone position she has extreme difficulty pushing up on her arms and therefore cannot roll from stomach to back. She is able to sit on her own but cannot get into the sitting position, crawl or walk on her own. She has very loose joints and low muscle tone. Since three months she has been fed through an NG tube and now has a G-tube. She does not eat solid foods but will put them in her mouth and then not swallow. The doctors have ruled out cystic fibrosis, and Prader-Willi and Williams syndromes. All blood work and CT and MRI scans are fine. We are now awaiting an experimental chromosome test. If anyone has any idea what my daughter may have, we would greatly appreciate any help.

—D&CP via EP Web Site

S Communication problems

I am trying to find some alternative ways of being able to communicate with my son. He is a five-year-old developmentally delayed child who has vision and hearing impairments and is non-verbal. The school and I have been trying to teach him ASL, and he has learned just over 50 signs. The problem is that he is getting increasingly frustrated and starting to have behavior problems. I think that we need to find other means for him to communicate his wants and needs. Does anyone know a place where I can look for help?

—PA, via EP Web Site

S Lattice Corneal Dystrophy

My grandson has been diagnosed with Lattice Corneal Dystrophy. He cannot handle being in strong light or sun light. Does anyone else have or know a child that has this disorder?

—DE via EP Web

S Ring chromosome 14

I have a 16-year-old son who was born with ring chromosome 14, a very rare condition. Does anyone else have a child who is suffering from the same disorder who can offer advice?

—LM, via EP Web Site

HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas

The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

S

Medically fragile in the classroom

My son has pulmonary hypertension and his cardiologist has recommended that he receive homebound services for kindergarten and stay away from other children, especially during the winter months. Andrew really wants to attend school with the other children. Any suggestions about how to accommodate a medically fragile child in the classroom?

—A, via EP Web Site

S

Seeking information on cochlear implants

My three-year-old son is being considered for a cochlear implant. He also has cerebral palsy and vision problems. I would like to know more about the implants and how a child is tested for them.

Respond

R

Sign language concerns

182 has a five-year-old grandson with Down syndrome and wants to know if she should concentrate on sign-language to communicate.

I have an eight-year-old daughter with Down syndrome. When she was younger, we opted to forgo sign language, as we were concerned she would become dependent on it. Of course there is no way of knowing if we made the right choice or not. Just this year, her therapists have incorporated some signing and her speech continues to improve. Most people (even those not familiar with her) understand some of what she is saying now. If your grandson hasn't gotten this, I am sure it is never too late to start. I just thought another experience might give you some encouragement. Best of luck.

—D, via EP Web Site

R

Dental care

210 (June, 02) has a 20-year-old son who is mentally retarded with a dental cavity and is seeking advice on how to handle dental care with special needs children.

I am an anesthesiologist and the parent of a 17-year-old with severe developmental delays. My son requires general anesthesia for dental work and other examinations. First of all, you need to find a dentist who is experienced in working with patients under anesthesia. You can call your local children's hospital, ask for the anesthesiologist on call and ask which dentists frequently bring patients into the operating room for dental work. There are many things you can do to help the procedure go more easily. Ask your physician for EMLA cream. This is a local anesthetic cream that can be applied to numb the skin so that he will not feel the IV needle. It needs to be applied two hours before starting the IV. You can ask to stay with him until he is asleep and be called to be with him before he wakes up, if this would help him remain calm. You will need to find out whether he will need to be completely asleep or just sedated (there are pros and cons to both), depending on what needs to be done and what you anticipate his reaction will be. If he does need to be completely asleep, ask for something to prevent vomiting. Anesthesia is extremely safe these days, but because of the special needs issues you have to be a little more demanding than the average parent usually is.

—AH, via EP Web Site

There are several options to control the movements of your son so that his dental care can be completed. One such option is to admit your son to a surgical center for outpatient general anesthesia. In many large cities there are anesthesiologists who have office-based practices and will come to the dentist's office to administer the anesthesia. If your son will not allow his dentist even to clean his teeth, then starting an IV line will be a challenge. An anesthesiologist can sedate your son in such a way so that an IV line can be started safely and without injuring your son. Office based anesthesia administered by someone other than the doctor performing the dental procedure is both cost effective and far safer than any other method.

—RS, DDS, via EP Web Site

My 13-year-old son, who has cerebral palsy, has a wonderful dentist whom he sees regularly. Fourteen months ago, he had an accident that necessitated emergency oral surgery. The oral surgeon expertly put him to sleep to do the work. A few months ago, as a result of this same accident, my son needed a root canal. The endodontist performed the work at the oral surgeon's office so that my son could again be put to sleep. This coordination was essential in completing the work.

—TB, via EP Web Site

R

Botox injections

54 has a nine-year-old daughter with cerebral palsy and is looking for information on botox injections.

Our nine-year-old daughter has CP and went three times for Botox. There is a great report on Botox in the May 2002 issue of EP explaining everything we parents must know before doing it. There are no side effects and it helps a lot with movement disorders. I hope it helps you.

—PC, via EP Web Site

Our 4-year-old son just had botox injections in his legs. I was really worried about the pain issue as well, but am happy to report that-with a dose of ibuprofen before, and comforting right

continued on page 20

continued from page 19

afterwards-he did very well. Hope it goes as well for you.

—*H, via EP Web Site*

School Harassment

598 (August, 02) has a 14-year-old son who has mild to moderate mental retardation, a speech difficulty and learning disabilities. He is being harrassed at school by non-special-ed classmates.

IDEA requires your district to provide a program for your child in the "least restrictive environment." That means that if your child can handle an integrated setting, he must be provided with one. That might not solve the harassment problem, but the more other children interact with him, the more they will understand him. You may also want to press for staff training in diversity and have the school add tolerance to their curriculum. While most professionals hate to see anyone ridiculed, they sometimes lack the tools to adequately prevent it.

—*L, via EP Web Site*

An accessible bathroom

193 needs help in designing a bathroom for a seven-year-old son with severe disabilities.

I recently had my son's bathroom remodeled through Assistive Technology. The cost was all donated by the program. They installed a preschool-size potty that was very low to the floor, but otherwise completely normal in appearance. This is great for my son, who has short stature due to Robinow Syndrome. I would call large plumbing supply stores and ask if they carry these toilets. You want one with a tank and not the open plumbing in the back like you may see at a school. We also had his bathroom vanity remodeled to his height. The sink handle is on the side (not the back) and the water flow is controlled by lever handles instead of knobs. We also had a sensor installed on his light so that when he enters the bathroom it automatically comes on and stays on until it no longer senses motion. These are only about $30 or less plus the cost of installation. Maybe you can ask a local plumber or electrician in your area to donate the installation of any of these items. You might be amazed that they will do it for free to help out a child. Good Luck.

—*KO, via EP Web Site*

Behavior concerns

653 has a eight-year-old son with Down syndrome and is looking for help with behavior problems in school.

I'm not sure what state you are in, but I would check to see if there is a behavioral specialist in the school system. I live in Loudoun County, Virginia, and have an eight-year-old daughter with Down syndrome. If a behavior becomes an issue, they bring in a specialist who observes the child to see if they can find out what is causing the behavior. The specialist then works with the teacher and the parents, if it is necessary, to come up with a proper plan to stop the behavior. Feel free to contact me if I can be of any further help. Best of luck to you.

—*DD, via EP Web Site*

Wheelchair capabilities

597 (July, 02) has a son with spina bifida and is looking for a way that he can use a wheelchair in their grass yard.

We have had a beach wheelchair from Surf Chair of Daytona Beach, Florida, for about four years. It is just great! It will go over sand, snow or other uneven terrain. This chair is both sturdier and less expensive than many others on the market. It is also one of the few that is made with marine-quality components, so that it can withstand oceans and salt water. When we bought ours, Surf Chair was selling a high and a low (standard) model. Although we are happy with our higher chair, we find we could have gotten along with the lower model, and it would have put more weight nearer the ground—perhaps a little safer. The chair we have is easy to push, however, and our son is a big guy. It may be that Surf Chair makes a folding model by now. I got their number from the Daytona Beach Chamber of Commerce, who told me a town lifeguard began making sand chairs after he witnessed too many beachgoers struggling to get to the water. Another way you might approach this is to see if someone on this web site has a beach chair they are not using. Also, some beaches have beach chairs available free, but you may want to call ahead or arrive early to get one.

—*PJ, via EP Web Site*

Controlling seizures

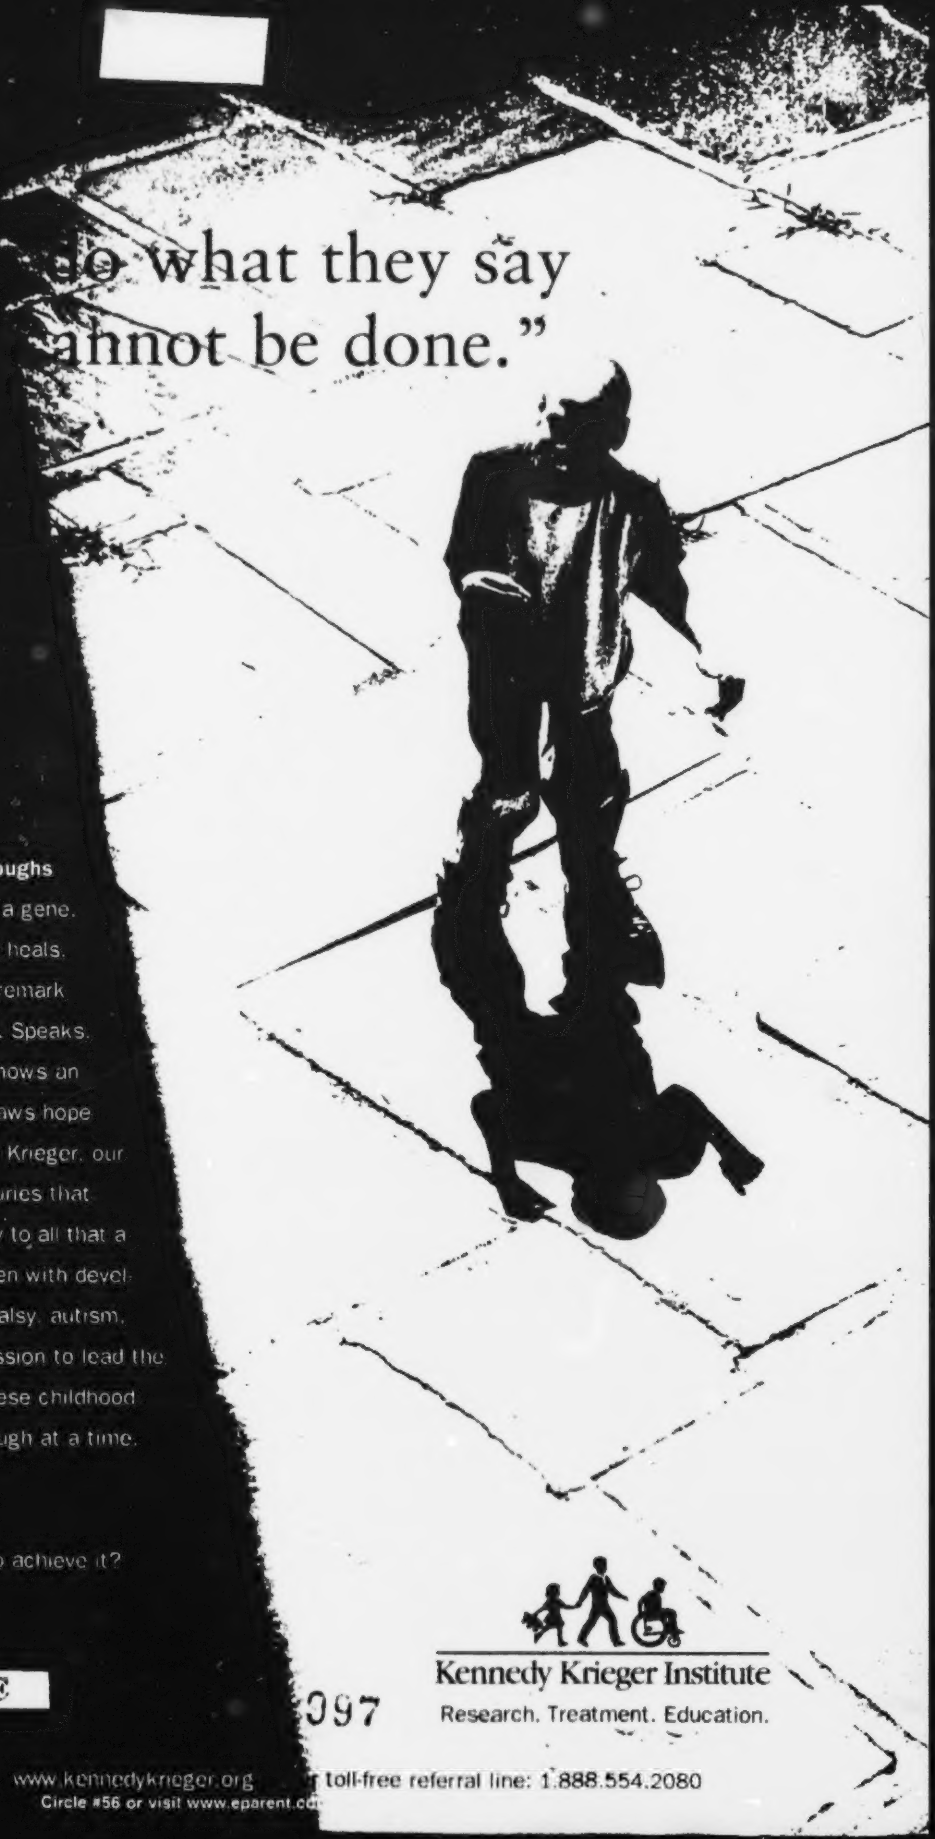
A&RM have a four-year-old daughter who is experiencing seizures. They have tried many medicines that have not succeeded in helping her.

My son is on Topomax for his seizures as well as Klonopin. With these two medications, his seizures have been under control. However, what you are describing also sound like symptoms of gastroesophageal reflux with the arching, crying and agitation. My son has reflux and is on Prilosec which has helped tremendously. You may want to consult with your pediatrician or gastroenterologist regarding this possibility.

—*SE, via EP Web Site*

Regarding seizure control, after trying over 30 medications, our 16-year-old daughter had a vagal nerve stimulator implanted. It was slow to work but we managed to get to mono-therapy for over six months. It works better for some kids and not at all for others. She is now having more seizures but VNS did allow her a better quality of life. I hope that you have the same success.

—*JT, via EP Web Site*



At Kennedy Krieger, dramatic breakthroughs are made everyday. A scientist isolates a gene. A therapist unravels a mystery. A doctor heals. A teacher connects. And then, the truly remarkable breakthroughs begin. A child walks. Speaks. Ties his shoe. Remembers her name. Knows an answer. Makes a friend. And a family draws hope where once there was none. At Kennedy Krieger, our sole focus is on those problems and injuries that affect a child's developing brain - the key to all that a child is and can become. We treat children with developmental disabilities such as cerebral palsy, autism, Down syndrome and others. It is our mission to lead the way in the research and treatment of these childhood brain disorders. One dramatic breakthrough at a time.

Every child is born with great potential. Shouldn't every child have the chance to achieve it?

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

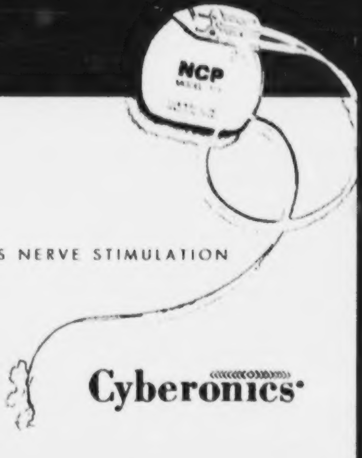
So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, your doctor about adding VNS Therapy. It's not brain surg It's a medical device the doctor implants in the chest, leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, no debilitating side effects, and improvement in alertne fatigue and mood. Some patients are even helped dramatically as Brady, although VNS results may vary.

BEST COPY AVAILABLE



VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

VNS THERAPY

VAGUS NERVE STIMULATION

Cyberonics

Circle #38 or visit www.eparent.com/adinfo

EXECUTIVE SUMMARY[1]
SAFETY INFORMATION
FOR THE NCP® SYSTEM

INTENDED USE / INDICATIONS – UNITED STATES

The NCP System is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications.

CONTRAINDICATIONS

- The NCP System cannot be used in patients after a bilateral or left cervical vagotomy.
- Do not use short-wave diathermy, microwave diathermy, or therapeutic ultrasound diathermy on patients implanted with the NCP System. Diagnostic ultrasound is not included in this contraindication.

WARNINGS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals. This is not intended to serve as a substitute for the complete NCP System Physician's Manual.

⚠ The **safety and efficacy** of the NCP System has not been established for uses not covered in the "Intended Use/ Indications" section of the manual.

⚠ The safety and efficacy of the NCP System treatment has not been established for stimulation of the **right vagus nerve** or of any other nerve, muscle, or tissue.

⚠ **Excessive stimulation** at a combination of high frequency (≥ 50 Hz) and an excess duty cycle (that is, one that occurs when ON time is greater than OFF time) has resulted in degenerative nerve damage in laboratory animals. An excess duty cycle can be produced by continuous or frequent magnet activation (> 8 hours), as determined by animal studies. Cyberonics recommends against stimulation at these combinations of ranges.

⚠ **Aspiration** may result from the increased swallowing difficulties reported by some patients during stimulation. Patients who have **pre-existing swallowing difficulties** are at greater risk for aspiration.

⚠ **Device malfunction** could cause painful stimulation or direct current stimulation. Either event could cause nerve damage and other associated problems. Patients should be instructed to use the magnet to stop stimulation if they suspect a malfunction, and then to contact their physician immediately for further evaluation. Prompt surgical intervention may be required if a malfunction occurs.

⚠ Susceptible patients with predisposed cardiac conduction systems (re-entry pathway) have not been studied as part of controlled clinical trials to establish the safety of NCP system treatment in these patients. Evaluation by a cardiologist is recommended if the family history, patient history, or electrocardiogram suggests an abnormal cardiac conduction pathway. Serum electrolytes, magnesium, and calcium should be documented before implantation. Post-implant electrocardiograms and Holter monitoring are recommended if clinically indicated.

⚠ **Sudden unexplained death in epilepsy (SUDEP):** Through August 1996, 10 sudden and unexplained deaths (definite, probable, and possible) were recorded among the 1,000 patients implanted and treated with the NCP device. During this period, these patients had accumulated 2,017 patient-years of exposure. Some of these deaths could represent seizure-related deaths in which the seizure was not observed, at night, for example. This number represents an incidence of 5.0 definite, probable, and possible SUDEP deaths per 1,000 patient-years. Although this rate exceeds that expected in a healthy (nonepileptic) population matched for age and sex, it is within the range of estimates for epilepsy patients not receiving vagus nerve stimulation, ranging from 1.3 SUDEP deaths for the general population of patients with epilepsy, to 3.5 (for definite and probable) for a recently studied antiepileptic drug (AED) clinical trial population similar to the NCP System clinical cohort, to 9.3 for patients with partial onset epilepsy.

⚠ **The NCP device is not curative:** Physicians should warn patients that the NCP System is not a cure for epilepsy and that since seizures may occur unexpectedly, patients should consult with a physician before engaging in un-supervised activities, such as driving, swimming, and bathing, and in strenuous sports that could harm them or others.

⚠ **Obstructive Sleep Apnea:** Patients with obstructive sleep apnea (OSA) may have increased apneic events during stimulation. Cyberonics recommends care when treating patients with preexisting OSA. Lowering stimulus frequency or prolonging OFF time may prevent exacerbation of OSA.

PRECAUTIONS

Physicians should inform patients about all potential risks and adverse events discussed in the NCP System physician's manuals.

⚠ **Laryngeal irritation** may result from stimulation. **Patients who smoke** may have an increased risk of laryngeal irritation.

⚠ **Dyspnea** may result from stimulation. **Patients with chronic obstructive pulmonary disease** may have an increased risk of dyspnea.

⚠ It is important to follow **recommended implantation procedures and intraoperative product testing** described in this manual. During the intraoperative Lead Test, rare incidents of bradycardia and/or asystole have occurred. As of October 1998, approximately 3,000 patients had been implanted with the NCP System. Four of these patients were reported to have experienced **bradycardia and/or asystole** during the intraoperative Lead Test. All four patients recovered without sequelae. One of the four patients was implanted with the NCP System. There were no postoperative or VNS-treatment-related cardiac adverse events later reported for that patient. No similar events were reported to have occurred during the clinical studies at the time of implantation or during treatment. The safety of this therapy has not been systematically established for patients experiencing bradycardia or asystole during NCP System implantation.

⚠ **Reversal of lead polarity has been associated with an increased chance of bradycardia** in animal studies. It is important to make sure that the Lead connector pins are correctly inserted (white marker to + connection) into the Pulse Generator header.

⚠ It is important to follow **infection control procedures**. Infections related to any implanted device are difficult to treat and may require that the device be explanted. Cyberonics recommends that the patient be given antibiotics preoperatively. The surgeon should ensur that all instruments, including the NCP Tunneling Tool, are sterile prior to the operation.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve** in the neck area inside the carotid sheath.

⚠ The NCP System is indicated for use only in stimulating the **left vagus nerve below where the superior and inferior cervical cardiac branches separate from the vagus nerve.**

⚠ **A neck brace** can be used by the patient for the first week to help ensure proper Bipolar Lead stabilization.

Environmental and Medical Therapy Hazards

⚠ Patients should exercise reasonable caution in avoiding devices that generate a **strong electric or magnetic field.** (For examples, see the "Other Environmental Hazards" section of the Physician's Manual.) If a Pulse Generator ceases operation while in the presence of electromagnetic interference (EMI), moving away from the source may allow it to return to its normal mode of operation.

⚠ NCP System operation **should always be checked** by performing device diagnostics after any of the procedures mentioned in the Physician's Manual.

⚠ Because of where the Pulse Generator is implanted in the chest, **patients may need to be specially positioned in mammography equipment for clear imaging**. Otherwise, the device may be seen as a shadow on the mammogram. (Most routine diagnostic procedures, such as fluoroscopy and x-radiography, are not expected to affect system operation.)

⚠ **Therapeutic radiation** may damage the Pulse Generator's circuitry, although no testing ha been done to date and no definite information on radiation effects is available. Sources of such radiation include therapeutic x-rays, cobalt machines, and linear accelerators. The radiation effect is cumulative, with the total dosage determining the extent of damage. The effects of exposure to such radiation can range from a temporary disturbance to permanent damage, and may not be detectable immediately.

⚠ **External defibrillation** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for external defibrillation.

⚠ **Electrocautery surgery** may damage the Pulse Generator. Please refer to the Physician's Manual for complete instructions for electrocautery surgery.

⚠ **Magnetic resonance imaging** (MRI) should not be performed with a magnetic resonance body coil in the transmit mode. The heat induced in the Bipolar Lead by an MRI body scan can cause injury.

Use caution when other MRI systems are used, since adverse events may occur because o different magnetic field distributions.

⚠ No scan in which the radiofrequency (RF) is transmitted by the body coil should be done on a patient who has the NCP System. Thus, protocols must not be used which utilize local coils that are RF-receive only, with RF-transmit performed by the body coil. Note that some RF head coils are receive only, and that most other local coils, such as knee and spinal coils, are also RF-receive only. **These coils must not be used in patients with the NCP System.**

⚠ **Therapeutic ultrasound.** Routine therapeutic ultrasound could damage the Pulse Generator and may be inadvertently concentrated by the device, causing harm to the patient.

⚠ **Extracorporeal shockwave lithotripsy** may damage the Pulse Generator. If therapeutic ultrasound therapy is required, avoid positioning the Pulse Generator part of the body in the water bath or in any other position that would expose it to ultrasound therapy. If that positioning cannot be avoided, program the Pulse Generator output to 0 mA for the treatment, and then after therapy, reprogram the Pulse Generator to the original parameters.

Diagnostic ultrasound is not expected to affect the NCP System.

⚠ The Pulse Generator may affect the operation of **other implanted devices,** such as cardia pacemakers and implantable defibrillators. Possible effects include sensing problems and inappropriate Pulse Generator responses. If the Pulse Generator patient requires concurrent implantable pacemaker and/or defibrillator therapy, careful programming of eac system is necessary to optimize the patient's benefit from each device.

ADVERSE EVENTS

Adverse events reported during clinical studies as statistically significant are listed in alphabetical order Ataxia (muscle movements or twitching, generally associated with stimulation); Dyspepsia (indigestion); Dyspnea (difficulty breathing, shortness of breath); Hypesthesia (impaired sense of touch); Increased coughing; Infection; Insomnia (inability to sleep); Laryngismus (throat, larnx spasms); Nausea; Pain; Paresthesia (prickling of the skin); Pharyngitis (inflammation of the pharny throat); Voice alteration (hoarseness);Vomiting.

Other potential adverse events possibly associated with surgery or stimulation include but are n limited to the following:

Aspiration (fluid in the lungs); Blood clotting; Choking sensation; Damage to nerves or vasculature i the surgical area, including the carotid artery and jugular vein; Device (Generator and/or Lead) migration or extrusion; Dizziness; Dysphagia (difficulty swallowing); Duodenal ulcer, gastric ulcer; Ear pain; Facial flushing; Facial paralysis, paresis; Foreign body reaction to implants, including possible tumor formation; Formation of fibrous tissue, pockets of fluid; Heart rate and rhythm changes; Hiccuping; Incision site pain; Irritability; Laryngeal irritation (sore, painful throat); Left hemidiaphragm paralysis; Left recurrent laryngeal nerve injury; Left vocal cord paralysis; Low-grade fever; Muscle pain; Neck pain; Nerve injury; Painful or irregular stimulation; Skin, tissue reaction; Stomach discomfort; Tinnitus (ringing in the ears); Tooth pain; Unusual scarring at the incision site; Urinary retention; Vagus nerve paralysis; Weight change; Worsening of asthma and bronchitis; Worsening of cardiac abnormalities, including heart rate and rhythm.

⚠ Patients who manipulate the Pulse Generator and Bipolar Lead through the skin may damag or disconnect the Bipolar Lead from the Pulse Generator and/or possibly cause damage to t vagus nerve.

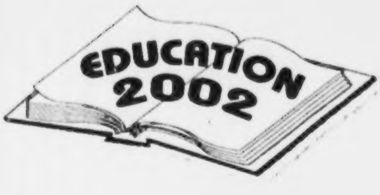
The information is not intended to serve as a substitute for a complete and through understanding of the material presented in all of the Physician Manuals for the NCP System and its component parts nor does this information represent full disclosure of all pertinent information concerning the use of this product, potential safety complications, or efficacy outcomes.



EP's TEACHERS of the Year

By Maria Tortoreto

This nation is blessed with extraordinary teachers. Among these selfless molders of our youth are teachers who choose to help educate children with disabilities. For our education issue this year, we have asked our readers to tell us about some of these "Gold Star" professionals who go that extra mile for special children.

The nominees are listed by state, in alphabetic order and with comments from those who nominated them.
Not every state is listed as only those teachers nominated by a parent or peer were considered and will receive a certificate of distinction. If you have a favorite teacher, please send his or her name and your comments to us. We need your help to expand this recognition program for next year!

All of us had a favorite teacher growing up. The teacher who was everyone's friend, who made even the worst subjects interesting, the one who encouraged scribbling poetry on the back of notebooks, the one who still remembers when he/she had our older sibling in class. They may not have profoundly changed our lives by helping us pass a chemistry midterm, but at the time we appreciated it, and we will always remember them by their willingness to help. Those are the good teachers.

But when a child has special needs and cannot physically, mentally or emotionally handle the pressures of conventional learning, a new approach must be taken. These children can be placed in regular education classrooms or in smaller special education programs, but some prosper only when given one-on-one attention in a custom fit routine. Either way, special needs students need confidence, a desire for knowledge, and, most importantly, a special person who can offer that to them. These special people must wholeheartedly believe in the child's abilities, and without them, great success is rarely achieved. Special people such as these do profoundly change lives. These are the exceptional teachers.

These teachers go above and beyond the call of duty for their students.

These teachers go above and beyond the call of duty for their students. They are dedicated to their work, often working extra hours inside and outside of the classroom to help their students succeed. Undying patience, creativity, and charisma day after day are the necessary factors in the success of students, and for many special needs educators these characteristics come naturally. In most cases these teachers are underpaid for their invaluable work, but they do it willingly and lovingly. After all, a simple "thank you" years later can make their jobs worth every minute. These outstanding individuals may not often be recognized for their work, but their work is certainly appreciated.

However big an impact a teacher or mentor can make on a child's life, it is important for him or her to realize that other people influence the child as well. Many of these teachers constantly ask for feedback and suggestions from parents and other teachers, and work those into the child's program. Often they work with administrators in the school district to acquire necessary support or funding. They take the time to continue their own education on disabilities, and they lead workshops for others in the community.

Craig Phillips of Kansas, a vision specialist working with Jessica Lawler, who has a visual field cut, created special glasses for her teachers so that they could understand how she sees the world. Joanne Boyer, a third grade teacher in Pennsylvania who had Scott Exler, a boy suffering from

TEACHERS OF THE YEAR

CALIFORNIA

Judy Coryell
Penfield School, Ventura
"Judy is the greatest, most loving, spectacular person. I am so glad she has been my little one's teacher."

Lisa Venske
Gidley School, El Monte
"She truly loves what she does and without a doubt, she loves the children."

FLORIDA

Marcy Hersch
Nova Southeastern University, Davie
"She has charisma and a dynamic with the moms and our kids!"

Debby Jones
First United Methodist School, Kissimmee
"This is a teacher who doesn't know the meaning of 'can't.' She has been a beacon of courage to our children."

Luanne Key
Mill Creek Elementary School, Kissimmee
"Mrs. Key has helped our family tremendously. This lady has a heart of gold."

Marisol Rodriguez
Thacker Avenue Elementary, Kissimmee
"The exceptional student populations are so fortunate to have such a good teacher."

Gillian Biggers
Mill Creek Elementary School, Kissimmee
"She has helped so many autistic children move on… she is very good at what she does."

Ruth Howell *
Ocean Breeze Elementary School, Indian Harbour Beach
"After coming out of a self-contained class into a regular class, Ruth made my son's sixth grade year a successful one."

Valerie Lundin
Cotee River Elementary, New Port Richey
"Val is the best thing that has happened to our school and our county's Special Olympics program."

GEORGIA

KK Springer
Joseph Sams School, Fayetteville
"She is very motivational with the children. She takes the time to make things work."

Hilda Taylor
Arcado Elementary School, Lilburn
"Hilda Taylor has a gift for making students beam with pride at their own successes."

IDAHO

Carrie McKay
Whitman Elementary School, Lewiston
"My son not only got an education, but also love and attention from a truly dedicated person."

IOWA

Emily Thatcher
Roland-Story High School, Story City
"Emily strives to make it possible for her students to have every opportunity to grow and learn."

KANSAS

Craig Phillips
Lawrence Public Schools, Lawrence
"Mr. Phillips has taught my child how to get around in the world."

LOUISIANA

Karla Ritter
Myrtle Place Elementary School, Lafayette
"She takes the extra time with the child, keeps open communications with parents and is not afraid to voice her opinion."

MASSACHUSETTS

Kerry Ann
Next Generation Children Centers, Westborough
"Kerry and her co-teacher Mary Beth are what every parent considers a gift!"

Zarrin Atkins
Apple Valley Montessori School, Sudbury
"Zarrin proved that through a fully inclusive program my daughter could function successfully in an educational environment."

Joan Bregy
Community Therapeutic Day School, Lexington
"She has turned my daughter's whole school experience around!"

Janis Chapman
Memorial Park School, Rockland
"She is a super person that a parent can talk to on any level. She has made a world of difference with my child."

Susan Ciaccio
Westford
"Sue is a very big asset to this community, and is very much respected by her coworkers and the school administration."

*** Teachers with an asterisk are not special education teachers, but were nominated for their work with children with disabilities.**

continued from page 25

systemic lupus erythematosus, in her class, wrote a book about Scott's experience which was recently published. Valerie Lundin organized a special education talent show in Florida, which is now a yearly event.

Including special needs students in the general education classroom is not an easy task, since different learning programs are used simultaneously; however, some teachers do this proudly. Donald Brubaker of New Jersey has always made sure that Kelly Stout, who has spastic quadreplegia cerebral palsy, is an integral part of the student body. "From skating with her at a school roller skating party to riding on the back of her power wheelchair, he has always found a way to make her feel special," says mom Joyce.

Gene Winn of New Mexico, a vocational teacher, always uses positive encouragement with all of his students. Rudy, who has cerebral palsy, has never been limited in his participation in class or in outside activities.

Teachers who reach out and touch students with their insight and generosity not only help the children, but the parents as well. They get to know the family and the environment in which they live in order to fully grasp the child's viewpoint and understand behavioral problems.

When Karin Swenson of South Dakota had another baby, her daughter Sonja had trouble dealing with the change. It was Barb Halvorson, Sonja's teacher, who brought her out of her shell. Behavior problems in Sonja arose, "but Barb helped her focus on the positives of being a big sister," says Karin.

Emily Thatcher of Iowa knew well in advance that she was getting a new student, Justine Dillavou, in her classroom. Before the actual move, Ms. Thatcher made special trips to Justine's old school to acquaint herself with the program, and put pictures of Justine in her own classroom to prepare her other students for a new classmate.

Teachers must understand that it is possible for a child to learn, and they must make the child understand that as well. They must set high expectations, but never so high that the child cannot meet them.

Jeanne Clapper believes that Lydia Shields of Massachusetts has had a tremendous impact on her daughter Stephanie. "Mrs. Shields has seen to it that Stephanie be accountable for her actions, both

R.E.A.L. Design Introduces VIVO™
The New Multi-Therapy Pony

Children will love VIVO, the playful, spirited little pony with the head that bounces when moved and a colorful beaded tail. Parents and therapists will appreciate the valuable skills children gain by playing on VIVO because it functions as a balance rocker or gait trainer by simply interchanging the legs which snap on and off easily. As a rocking horse, VIVO promotes balance reaction skills and upper body postural development. As a gait trainer, it provides incentive for a child to learn ambulation skills. The soft upholstered seat back, with molded laterals, is height adjustable to position children comfortably and securely for rocking or learning to walk. Accessories are available for adapting VIVO to a child's positioning needs.

continued from page 29

positive and negative. She has never accepted mediocrity from Stephanie. She expects that she can learn, and sees to it that she does."

"At a time when my son felt he could do nothing right and was struggling to just make it through lunchtime in the cafeteria without getting in trouble, it was Mrs. Taylor who saw Jon's musical talent and used it to help him achieve success," says Jane Frederick of Georgia teacher Hilda Taylor.

These selfless people work wonders.

For Cindy Cotter of Florida, Debby Jones has been like a member of the family. Her three children, Barbara, Chris and Billie Rebecca, all have disabilities, and Mrs. Jones has helped each of them. "She saw potential in them that others were unwilling to see," says Cindy. "She has a way with the kids. Autistic children don't always take to other people well, but my daughter Billie Rebecca does extremely well with Mrs. Jones."

These selfless people work wonders with children who have trouble learning. They have calmed fears and dried teary eyes, helped with future planning and taught independence. In a world that can be cruel to people with disabilities, it is teachers like these who guide them through it.

Alan Bloom has been struggling to find an appropriate educational program to accommodate his daughter Emma. "She is who she is, and we need to do everything we can to help her adjust to the world—and, at times, to help the world adjust to her—so that she can grow up to be happy. That is our #1 mission, and thanks to Joan Bregy of Massachusetts, we feel for the first time like that's a realistic goal."

Mark and Nicole Schmidt of North Dakota feel blessed to have Sharon Olson in their lives, and especially in the lives of their twin boys. To her and to all of the nominees, the Schmidts write, "Thank you for your hard work, dedication, love and selfless hours of special needs teaching. Our children love you and so do we."

Berkshire Meadows

Nestled in the serene beauty of Western Massachusetts' Berkshire Hills, Berkshire Meadows offers a comprehensive, integrated year-round residential program for children, adolescents and young adults who are severely developmentally delayed and may be multiply disabled.

We help our population become more independent, more self-sufficient and empowered. For their families we strive to offer education, encouragement, and support. We believe that all people, no matter how severe their disabilities, should be given the opportunity to achieve their maximum potential.

EDUCATION 2002

TWINS TRANSITION AND LEAVE BEHIND A CHANGED SCHOOL SYSTEM IN THEIR WAKE

By Laura Apel

Alba and Anastasia Somoza will be two of the thousands of freshmen entering the college graduating class of 2006, but this achievement did not come easily for them, their family, or the New York City Board of Education.

The twin girls were both born with quadriplegia cerebral palsy, and because of this no one expected them even to earn a high school diploma. However, this past June the girls graduated as honor roll students from Manhattan's "School of the Future." Now they head off to two of the country's top colleges: Alba to Queens College in New York City and Anastasia to Georgetown University in Washington, DC.

> In a nationally televised town hall meeting that year, Anastasia Somoza appealed to then-president Bill Clinton as well as the New York City school system, asking that she, as well as her sister Alba (the more severely disabled of the two), be allowed to learn in regular classes.

Many parents of children with disabilities spend a great deal of time considering the academic options for their children after high school. More and more parents and students are utilizing schools that are solely devoted to those with learning and physical disabilities, but many families neglect to consider the possibility that their children will be able to live and thrive at a regular four-year college or university.

Every situation is unique to a particular student and family, but Alba and Anastasia have proven that just because something appears to be beyond their capabilities does not meant that it truly is, but instead that it has simply not yet been tested. They have faced a challenge at each level of their academic lives so far and come away among the top students entering college this year, proving that they have deserved every success they have accumulated.

EP Magazine has already chronicled the Somoza family's many hardships and battles to receive proper treatment within the public school system and the medical community (May, 1996). Now, six years later, Alba and Anastasia have proven that it was worth the effort.

Alba and Anastasia's mother, Mary, began her battle with the New York City school system in 1993, asking for the inclusion of her daughters into the mainstream program at P.S. 234. In a nationally televised town hall meeting that year, Anastasia Somoza appealed to then-president Bill Clinton as well as the New York City school system, asking that she, as well as her sister Alba (the more severely disabled of the two), be allowed to learn in regular classes.

The Somoza family succeeded in their quest and the girls were mainstreamed, making Alba the first significantly disabled student to be fully integrated into the New York City

> Filled with a number of different emotions ranging from excitement to intimidation, the girls and their family are looking forward to the new adventure…

Public Schools. The girls faced another challenge three years later when Mary found that she now needed to struggle in order to send her daughters to District 2's "School of the Future" junior high school in 1996.

Mary saw the technologically advanced, junior high/high school as the ideal place for her daughters, especially Alba, as she is dependent on a computer for her communication. Placement there would also obviate the girls' need for another transition from junior high to high school levels.

The school district estimated that the cost of creating the appropriate facilities for the girls, mainly wheelchair accessibility, would be more than $1.2 million dollars. Somoza found the estimate excessive and began another battle in the name of her daughters' rights. With the help of the Eastern Paralyzed Veterans' Association and the New York City Lawyers in the Public Interest, Mary prepared her own report. This finding put the cost at $15,000.

The report forced the school administration to back down, and the girls were enrolled at the "School of the Future." There, they experienced many academic successes but are nevertheless eagerly anticipating their transition to college. Filled with a number of different emotions ranging from excitement to intimidation, the girls and their family are looking forward to the new adventure but feel, as Mary Somoza explained, that it is nevertheless "a daunting time."

TWINS TRANSITION

continued from page 33

Both girls have already begun their studies at their respective schools, as they have each taken part in summer programs and events. Alba will commute to Queens College from her family's home in New York City. She is currently making arrangements with the school's disability coordinator to accommodate her needs, which Mary Somoza will no doubt ensure are met. Alba is undeclared as to her major at this time

WHEN DETERMINATION WINS

Mary Somoza described an experience that Anastasia recently had while on a summer nature retreat at Georgetown with some of her classmates. In an attempt to create relationships and bonds among the freshman class, the students took part in exercises including mountain climbing and rope bridges in Virginia.

A quadriplegic, Anastasia faced the mountain in her wheel chair and informed her peers that she would be waiting at the bottom. To her surprise, her decision was not accepted by her classmates and friends, which included three members of the Division One universities football team. Together, the teammates carried Anastasia and her chair all the way up the mountain. When they reached the top and approached the rope course ahead, those around her realized that this time she would wait behind, as the rope would only allow for one person at a time in single file.

However, Anastasia decided to get up from her chair and walk across the bridge. To help with her balance, which is impeded by the cerebral palsy, the football players guided her, and thirty minutes later she was across and received with a sea of cheering and smiles. The end of the journey came in the form of a rope drop down the mountain in what Anastasia described to her mother as the most "awesome" thing she had ever done. Shortly after the event, the students wrote about their experiences that day and many chose to comment on Anastasia, what she had done, and how they were now awakened to how much a person could truly overcome.

BEST COPY AVAILABLE

> Excited to hear all about her daughter's time there, she instead was answered with the generic college-student-to-mother axiom, "Listen Mom, I have to go now; my friends are waiting. I'll call you later!"

but may pursue her interest in art as her study there progresses.

Anastasia also began her activities at Georgetown University this summer, but will move down permanently this fall with an aide. Also undeclared as of yet, Anastasia has expressed an interest in political science and may concentrate on it as her major in the future.

Alba, Anastasia, their mother Mary, father Gerardo, older brother Oliver and younger sister Gabriella are all excited and concerned for the twins as they leave their home for the first time, transition to new schools, and face life apart from one another – something they have never before experienced. Their collective hopes for this new adjustment are that the girls will each find in their college educations all that every other incoming freshman has the opportunity to experience.

Although the twins succeeded academically at the high school level, the social aspect of their time there was far less fulfilling. Mary's desire for her two daughters is that they will find the open-mindedness and tolerance in their peers at college that are so often absent from the thoughts of the average high school student. All she wants for her daughters, all she has ever wanted for them, is for them to be given the opportunity to have access to everything that others have received so freely.

All mothers are apprehensive about sending their children to college and being away from them for the first time. Because of her daughters' conditions, Mary Somoza is finding these feelings occurring at a much greater level. Nevertheless, her fears were lessened and replaced with another emotion when she called Anastasia during her recent stay at Georgetown. Excited to hear all about her daughter's time there, she instead was answered with the generic college-student-to-mother axiom, "Listen Mom, I have to go now; my friends are waiting. I'll call you later!" EP

EDUCATION 2002

HIGHER EDUCATION OPTIONS FOR YOUNG ADULTS WITH LEARNING DISABILITIES

by Carolyn O. Cantu, MS, OTR

"There are truly opportunities to achieve the dream of a college education [for students with disabilities]," Deborah Brodbeck, President of Beacon College, Leesburg, FL.

Two schools have uniquely positioned themselves to help challenged students and their families achieve a college education. They are Beacon College in Leesburg, FL, and Landmark College in Putney, VT.

Every fall semester, high school seniors and their parents experience excitement and anxiety as they make decisions regarding jobs or colleges. For students with learning disabilities, this season adds one more hurdle to the list of challenges that has grown during the past 12 school years. Often, young adults with learning disabilities have average to well-above-average intelligence and wish to continue their education. However, there are questions to be answered: What choices are there? What support can I/my child expect? Who has experienced satisfaction in this process?

Beacon College and Landmark College are two institutions that have provided answers, along with some very satisfied students and parents.

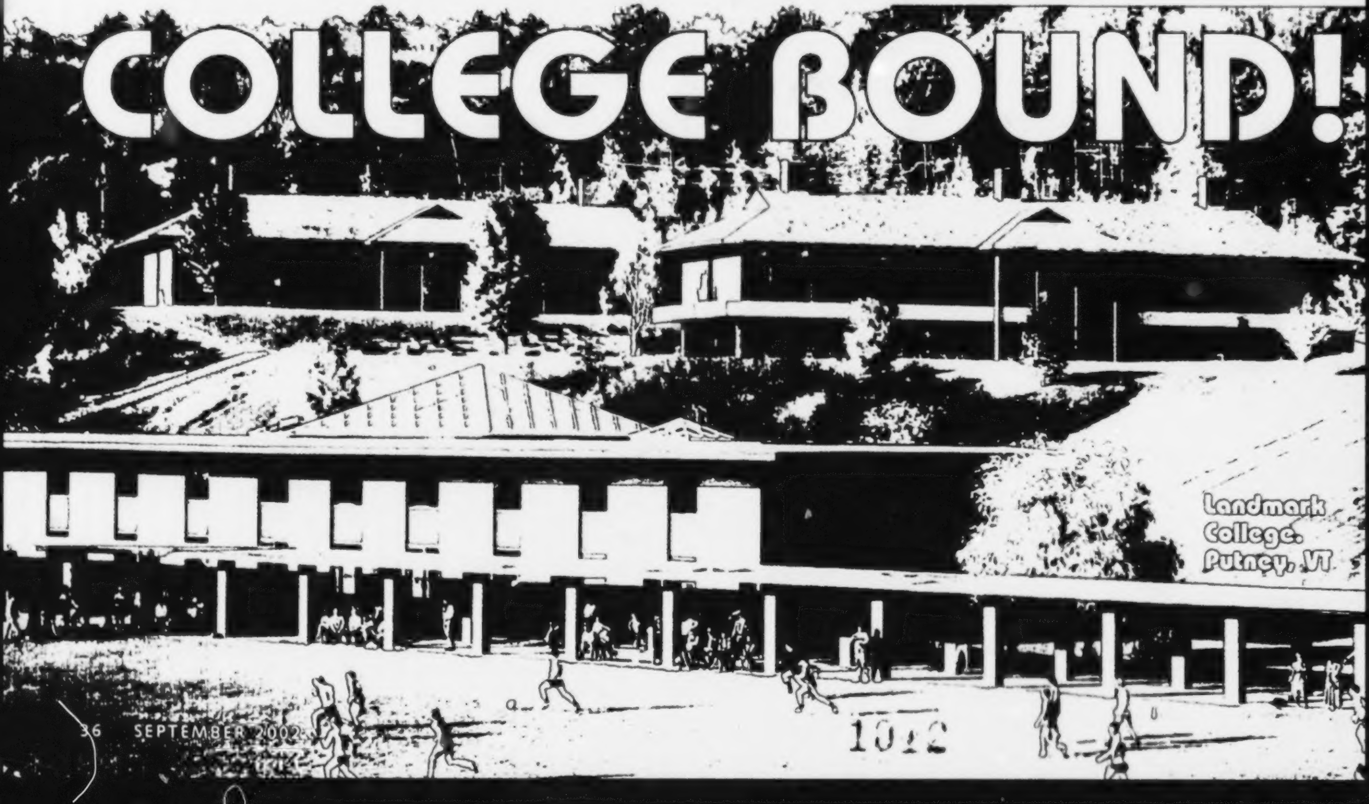
Beacon College, Leesburg, FL:

Located in Leesburg, FL, Beacon College was started by parents of teens with learning disabilities. Presently, it has about 80 students, each following a customized plan of study based on their strengths and needs. The primary disability that allows for admission is a learning disability followed by a physical disability, if relevant to the applying student.

Licensed by the Commission for Independent Education Colleges and Universities, Beacon awards Associate in Arts and Bachelor of Arts degrees in both human services and liberal arts. The school is also a candidate for accreditation by the Southern Association of Colleges and Schools (SACS) this October.

Beacon boasts a Main Street campus that allows students easy access to places for social gathering. Living accommodations are provided in apartments separate from the school campus and special transportation is available to take students to and from classes.

Community based field placements offer hands-on, practical work experience in public and community services.



COLLEGE BOUND!

Landmark College, Putney, VT

Placements are in the town of Leesburg and often lead to more permanent employment.

President Deborah Brodbeck believes that Beacon's cornerstone is their mentoring program. Students are assisted by mentors who help them determine their own realistic goals, discover which learning techniques work best for them in varied situations, enhance their abilities and explore their potential. "Students come into their own academically here" President Brodbeck declares.

Students also have access to tutors, psychologists and counselors who can help them discover who they are as learners and develop their own individualized strategy for learning. This development of self-awareness and cognitive strengths, as well as the acquired perception of realistic views and limitations, is influential in making future career choices.

The graduate success rate is impressive. As of December 2000, 100 percent of Beacon College graduates went on to higher learning or were hired directly out of school. The statistics for May 2001 showed that 90 percent of the graduates did the same.

Landmark College. Putney, VT:

Founded in 1983, Landmark had students enrolled for classes by 1985. Over the years the enrollment has grown to 380 with the expectation of up to 450 students in the future.

Landmark's mission is to provide a rigorous educational program for students with dyslexia, ADHD and special learning disabilities. The two-year program ensures a self-empowerment that is based on the development of academic strengths and the internalization of a positive self-esteem.

Admission to the college requires documented proof of a learning disability, dyslexia or ADHD from the secondary school's educational psychologist. Students are supported through each phase of the admission, transition and adjustment periods while attending Landmark. Curriculums are structured, defined and developed to ensure measurable results in the students' success during their initial higher education experience, and faculty understand that course of action.

Students live in residence halls supported by development professionals who live on each floor. This arrangement reinforces an integrated approach to college life that teaches students to balance social and academic experiences, while also providing a sense of community.

Instructor Mike Hutcheson describes Landmark as a place where "Our students aren't empty vessels that we fill with information. We look at an individual, assess strengths and weaknesses and develop methods that work for each student."

MARGUERITE: A CASE OF PERSEVERANCE

In 1993, fifth grader Marguerite Annis lived the life of a typical little girl. Suddenly, this lively ten year old developed persistent migraine headaches, blurred vision and projectile vomiting that could not be relieved with medicine. A MRI detected a tumor that had grown within the optic chiasm, impairing her vision and pressing on the hypothalamus gland. Pressure was moving toward the brain stem.

After many visits to the doctor and numerous tests, Mr. and Mrs. Annis took her to the Mayo Clinic in Rochester, MN. The tumor was removed and the first of six revised shunts was implanted. Although Marguerite's strength, coordination and ability to walk were not initially affected, her vision was impaired. Unfortunately, by the time she was 14 the tumor had grown back.

This time the doctor performed more aggressive surgery. He removed the tumor, keeping her personality intact, but sacrificing her short-term memory and vision acuity. In the following summer convulsive seizures started occurring. After frequent adjustments due to allergies, the medications were finally regulated. Ataxia accompanied by seizures developed, causing Marguerite to walk with an unsteady, weakly balanced gait that required the use of a cane. Physical therapy focused on walking, coordination and balance. In the midst of all this, she was living with diabetes insipidus.

By the tenth grade, Marguerite was falling behind in her studies. The public school's special education program arranged for her to have extra time to take tests and transfer to and from classes. "A closed door was not going to stop me!" Marguerite exclaimed as she described trying to pass through a closed door while negotiating both a walker and back pack during her years in high school.

After her sophomore year, she left the area high school and attended a school for children with special needs. In a wheelchair, Marguerite returned to the area high school for her senior year and graduated among her peers.

A crucial time was upon her. Where do I go? What do I do after high school? A special guidance counselor suggested Beacon College or Landmark College.

Now she is a junior at Beacon College, working towards a bachelor's degree in human services and hoping to someday further her studies. Marguerite continues to deal with the physical and mental impairments caused by extensive neurosurgery and seizures. Nevertheless, the determination and courage that propelled her towards achieving her dream of attending an institute of higher learning remains with her as the guiding force of her many successes. One closed door at the high school level did not stop her. Many more students are finding that they too have the same opportunities.

Fernando H. Shahbaznia, Associate Vice President of Institutional Advancement for Landmark College, emphasizes that this experience is not a "quick fix" toward higher learning. If a student demonstrates tenacity, hunger and a driving will to learn within the sustained process of learning, "a radical metamorphosis in achievement will occur."

He equates attending Landmark College with being surrounded by 380 mirrors, because students see themselves in what others are doing. The peer support and relationships that develop are lifelong and the network of alumni reaches through generations. "The borders of disability are dissolved and students are able to reach higher and higher for the keys to open doors of opportunity."

Both Beacon College and Landmark College are unique in that they exclusively admit students with learning disabilities. These institutions are dedicated to providing a supportive but vigorous atmosphere for learning at this level. Students develop a strong sense of self-esteem, self-awareness and lifelong learning or work strategies. Both programs present a holistic approach to learning in higher education and emphasize the "goodness of fit" with cognitive strengths usually leading to employment or higher education for students with learning disabilities. ◆

TIGER

The Tiger from R82 is a versatile dependent tilt-in-space push-chair that can handle the individual seating requirements of almost any child with special needs. The seat easily reclines from an upright to a horizontal position allowing your child to be active or relax. The seat width, depth, and back height adjust to expand as your child grows. The reversible seat allows a caregiver to maintain eye contact with the child at all times. The seat easily removes from the base for storage and transport. The cover easily removes for laundering.

The Tiger is available in two sizes and four fabric selections. Weight capacity for the size 1 is 77 lbs., and 110 lbs. for the size 2. The Tiger seating system can be utilized on several of our mobility frames. Optional accessories include a variety of headrests, harnesses, straps, swing-away lateral supports, and more.

RIDGEWAY

A VERY SPECIAL SCHOOL

When they first enter the main building, potential students and teacher applicants speak of a "different" feeling that pervades the Ridgeway School in Severn, MD.

When asked to describe this feeling, current teachers, administrators and parents have difficulty articulating what is an essential part of this nationally renowned cluster school in suburban Washington, DC. Asked to describe Ridgeway in one word, administrators say "caring." Faculty say "commitment." Parents say "community."

EP Magazine calls it "trust."

Taken together with its academic and athletic achievements, programs for gifted and challenged children and its overall level of excellence, this 630-pupil complex is EP Magazine's Educational Institute of the Year.

Headed by Duane Arbogast, Ridgeway School is housed in a two-year-old building, the planned capacity of which is already being outgrown. This fall, the elementary school, levels kindergarten through fifth grade, is supporting 100 students with disabilities, 25 of whom have severe or multiple disabilities.

Starting in homeroom, the school attempts to integrate all students. "We want everyone to feel part of the student body," says Arbogast. "We structure the school schedule around providing students with disabilities the best chance to be included."

Where possible, students with disabilities take the same classes as other students. "There is a climate of learning and accountability that includes every student," Arbogast says. "In short, we hold students with disabilities accountable just like any other student. In the process, we are able to get the support of the entire student body. They pitch in and foster this climate of participation and acceptance. The process is a learning experience for them as well."

Arbogast advises other educators in similar situations to focus on culture and structure. "By culture I mean a philosophy where special education is given a definite role within the overall structure," he said.

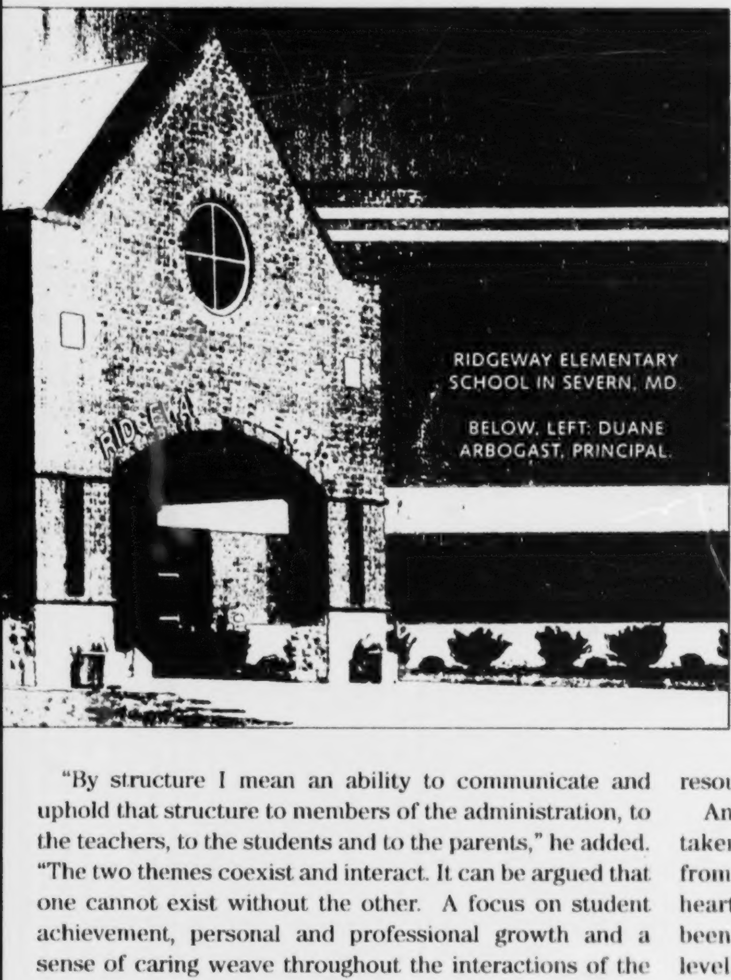
SCHOOL



RIDGEWAY ELEMENTARY SCHOOL IN SEVERN, MD.

BELOW, LEFT: DUANE ARBOGAST, PRINCIPAL.

"By structure I mean an ability to communicate and uphold that structure to members of the administration, to the teachers, to the students and to the parents," he added. "The two themes coexist and interact. It can be argued that one cannot exist without the other. A focus on student achievement, personal and professional growth and a sense of caring weave throughout the interactions of the daily life at Ridgeway."

"Children are to be treated as if they were our own," said Michele Overend, special education teacher. "We try to create an individual program for every student. Educational and placement decisions are based on how we would want our own children treated."

This sense of individualized training is extended to every student. Consequently, there is a high sense of trust from the community, says Leslie Twohig, a parent volunteer. "Parents of children without disabilities know that the school also focuses on those with exceptional talent," she said. "We all know the school focuses on the individual student and our children are getting a high level of education. This is a reason that such a great well of trust exists amongst us all."

Trust is a central tenet of the professional learning community. Through the shared vision of service to children and professional development, the staff at Ridgeway actively works to improve every facet of the program through reflection and critical analysis. Teachers are encouraged to take instructional risks in a supportive environment. With student growth and achievement as the goal, teachers implement new strategies, practice and revise instruction and reflect with colleagues.

Part of the school's success is the high degree of professionalism and dedication exhibited by the staff. Because they are part of the entire process, the teachers are committed to the structure and philosophy of Ridgeway.

"We like to think that they are 99 percent supportive of the programs and 100 percent involved in making it work," said Overend.

Arbogast said the school tries to create an individual program that works best for the child. Sometimes an entire family could be involved and requires the school to look at family issues and provide support, whether the issue is physical health, emotional health or guidance.

"Children with disabilities come from all over the county and parents even 'parachute' into the district to go to Ridgeway," Arbogast said.

Ridgeway also sometimes takes responsibility to educate the entire family through verbal and written communication. To do this, it must mobilize resources in the community to provide support for families.

An example of this vision is embodied in the actions taken when a family enrolled in April. The family was from Texas but spoke no English. The two-year-old had heart problems and Down syndrome. The 13-year-old had been retained in two grades and read at a first grade level. The nine-year-old had only limited English. The staff at Ridgeway was able to coordinate health and educational services for the two-year-old and provide age-appropriate instructional settings for the nine- and 13-year-old children.

"We like to think of ourselves as a safety valve for many local schools," Arbogast said. "We accept many students whose parents have fought with their school boards and finally they all agree that the child would be best at Ridgeway."

As a total educational facility, Ridgeway represents the best in American education and is extremely worthy of the award it will receive in October at the World Congress & Exposition on Disabilities. ■

EDUCATION 2002

Enhancing Inclusion with the Navy Run, Jump 'n' Throw

Joseph Valenzano, Jr., President, Exceptional Parent Magazine
Jim Santos, President, Navy Run, Jump 'n' Throw

This year, schools in California, Missouri and Maryland joined more than 22,000 other institutions conducting the Navy's Run, Jump 'n' Throw. These schools held programs geared for special needs students, thereby providing inclusion through sports in three exciting formats. Each event was successful in providing a fun, challenging and rewarding program for students with a disability.

In February 2002, Mr. Lee Webb, Head Track Coach and Adapted Physical Education teacher at the James Logan High School in Union City, CA, conducted the Navy Run, Jump 'n' Throw Olympic Clinic, which is now recognized as the largest track clinic for students in the United States. Athletes from the Special Olympics played an important role in this regional event which attracted 22 Olympic athletes and more than 2,000 students. Children from ages 8-18 were paired with students with a developmental disability, and as partners, they participated in the clinic.

In April of 2002 Mr. Webb was the Meet Director for the Navy Run, Jump 'n' Throw Track and Field Invitational Meet, established for high school athletes in northern California. The Invitational provided events in which Special Olympics athletes with a developmental or physical disability could represent their high school and compete in the same programs as their non-disabled peers. This two-day competition attracted more than 2,000 students.

In May, the St. Louis Special School District hosted the Navy Run, Jump 'n' Throw Sports Day. Directed by Ms. Jackie Rahm, Sports Director for the St. Louis County Special Olympics, this inclusive program featured the senior class of Hazelwood West High School as partners, officials and volunteers.

May 23, 2002 presented a wonderful opportunity for elementary students representing Ridgeway Elementary School, Marley Elementary, Jones Elementary and Meade Elementary at the Navy Run, Jump 'n' Throw Ridgeway Elementary Invitational in Severn, Maryland. A warm sun smiled on the opening ceremonies provided by the United States Navy Color Guard of Washington,

Students prepare for the big race

Left: A team of students in matching shirts head off for their event.

Below: Participants take a break from the busy day to smile for the camera.

Joseph M. Valenzano, Jr., President, CEO and Publisher of EP Magazine, poses with the United States Navy Color Guard of Washington, DC.

DC. More than 175 students took part in four different events during this three-hour invitational. To add to the occasion, Jim Santos presented Joseph M. Valenzano, Jr., President, CEO and Publisher of EP Magazine, the first Navy Run, Jump 'n' Throw President's Award for his continual support and promotion of the Navy RJT program.

This flagship event was put together by the Partners for Success of Anne Arundel County (a family support group for special needs children), Special Olympics Anne Arundel County and Special Olympics Maryland, who worked together to support the Ridgeway Elementary Invitational.

Why is the Ridgeway Elementary School the flagship for the Navy Run, Jump 'n' Throw? The answer is simple: because so many people were involved in making it an outstanding event. With more than 1,000 people representing students, Special Olympics, families, staff, administrators, Partners for Success and Navy Run, Jump 'n' Throw in attendance, this illustrates the best inclusion practices on or off the playing field. Sports just happen to be the vehicle for this inclusion activity.

Because the Navy RJT program is so unique, schools may choose to use the program in a variety of teaching and activities that suit the needs of their students and staff. It also may be the only time a student with a severe developmental disability will have a chance to wear a tee shirt representing his or her school, and play on the same team as non-disabled friends. Public and private schools throughout the United States are benefiting from the Navy Run, Jump 'n' Throw with a variety of opportunities for students, staff and teachers to learn about sports and each other. EP

To register to receive the Navy Run, Jump 'n' Throw Sports Guide at no charge, visit: http://www.runjumpnthrow.org. If you have further questions about any of these events, call Frank Kolarek, Vice President, Navy Run, Jump 'n' Throw at (410) 791-1023.

Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

WORLD CONGRESS & EXPOSITION ON DISABILITIES

WCD

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—
October 3 - 5, 2002

LOCATION:
Orange County Convention Center—
Orlando, Florida

A UNIQUE GATHERING—A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract **physicians • families • direct support professionals • people with disabilities • allied health care professionals • educators • adapted physical education specialists.**

TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more, hosted by America's Athletes with Disabilities.

EMPLOYMENT SYMPOSIUM AND PAVILION: Human resource managers will discuss career opportunities, sponsored by Florida's Agency for Workforce Innovation and the Florida Department of Education, Division of Vocational Rehabilitation Services (DVRS) and McDonald's Corporation.

ASSISTIVE TECHNOLOGY LEARNING CENTER: Produced by FAAST. Computer Stations designed for hands-on education and fun.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.

CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation, through approved accreditation institutions, will be offered for a dozen disciplines.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with Florida's Agency for Workforce Innovation and the DVRS will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

October 3-5, 2002 • WORLD CONGRESS & EXPOSITION ON DISABILITIES

Division of Vocational Rehabilitation Services (DVRS) Hosts Employment Symposium and Pavilion

Florida Department of Education

Florida's Division of Vocational Rehabilitation (DVRS) is helping to host a three-day employment symposium and pavilion to be held concurrent with the World Congress & Exposition on Disabilities (WCD) from October 3-5 at the Orange County Convention Center in Orlando, Florida.

The Symposium will feature over 50 workshops on disability issues designed to provide individuals with disabilities and their families, educators, employers, and DVRS counselors and customers a forum for information exchange. According to WCD organizers, the workshops will cover employment issues encountered "from the time a person wakes up in the morning until he or she goes to bed at night."

In addition to the basic issues of employment, speakers will discuss topics such as self-employment, mentoring, school-to-work transition, assistive technology, and national service opportunities.

DVRS is charged by both federal and state statutes with helping individuals with mental or physical disabilities that constitute or result in a substantial impediment to employment. Eligibility is based on the presence of a physical or mental impairment and a goal of employment.

Once individuals are deemed eligible, DVRS works with them to decide what type of services are necessary to overcome the impediment and how best to find either gainful employment or supported employment. Typical services might include training or retraining, school-to-work transition assistance, medical or psychological evaluation and treatment, and rehabilitation engineering or assistive technology.

Studies have shown that two out of every three people with a disability would prefer to be working and be self-sufficient. DVRS provides a hand up to self-sufficiency, not a hand out. On average, DVRS invests $2,917 per customer to assist Floridians with disabilities in overcoming barriers to employment. That investment yields an average income increase of $312,210 per customer over a 30-year work life, according to a 1999 study conducted at Florida State University. That income is then used to stimulate the economy through consumer spending and tax contributions and to reduce public spending previously used to support those Floridians with disabilities who would rather work.

For more information about the DVRS program, call (800) 451-4327 or visit the web site at http://rehabworks.org.

The WCD Employment Pavilion, also sponsored by McDonald's Corporation, will include human resource managers from dozens of companies, including local and national corporations as well as government agencies, for the purpose of discussing opportunities for those seeking employment.

we love to see you smile™

WCD EMPLOYMENT SYMPOSIUM TOPICS INCLUDE:

THURSDAY, OCTOBER 3

- Developing Quality Transition Individual Educational Plans
- Enhancing VR Services and Employment Outcomes Using AT
- Career Development Intervention for High School Students with Disabilities
- Self-Employment

EDUCATION 2002

HOW TO FIND A HIGH-QUALITY INCLUSIVE CHILD CARE PROGRAM

By Stacy Scott, M.Ed. and R.A. McWilliam, Ph.D.

The Individualizing Inclusion in Child Care model demonstration project, funded by the U.S. Department of Education, Office of Special Education and Rehabilitative Services (Grant No. H324M980207), has developed, implemented and evaluated a model for providing high-quality inclusive child care experiences for children with disabilities aged birth through five years. Stacy Scott, M.Ed., is the project coordinator of this effort and often fields questions from parents of children with disabilities concerned with proper care for their children. The following letter lead to the writing of this article.

> ***Dear Stacy,***
> ***I have been searching for child care for my three-year-old son, Garrett. Garrett has developmental delays and sees a speech therapist. I have been able to stay at home to take care of him up until now, but my situation has changed and I must return to work full time. The specialized programs I have been referred to that would address my son's needs last for only half the day. I need full-day child care. I have visited several regular child care programs in the area but none of the staff seem to have any experience with children with delays. I am aware that many child care programs have some type of rating that indicates the quality of care provided, but how can I determine the quality of care that will be provided to my child with special needs? Do you have any suggestions?***

Finding high-quality child care is a challenge for many families—one that is exacerbated for families of children with special needs. In their efforts to find out whether their options are of high quality, families might consider quality rating systems, association accreditations, and other overall quality indicators that have been developed. But what constitutes high-quality care for typically developing children might not be high quality for children with disabilities. How can families of children with disabilities ensure their child has a high-quality inclusive child care experience?

Beyond making sure that a child's basic caregiving needs are met (e.g., feeding, diapering and a clean, safe environment), parents of children with disabilities might be worried about:

- how their child will participate in daily classroom activities with peers;
- how different professionals working with their child will coordinate their efforts in different areas (e.g., positioning and handling techniques, specialized equipment, teaching strategies); and
- how their child's developmental skills will be addressed and extended to ensure that the child is reaching his or her full potential.

The Individualizing Inclusion in Child Care model project has successfully demonstrated how to assuage some of these concerns. The model's three key components are:

- providing caregivers with a system for functional assessment and intervention planning;
- integrating related services; and
- addressing children's individualized needs within the context of classroom routines.

Families can use this model of best practices to identify the appropriateness of a child care program. Over the years, we have found it useful to think of children's needs in terms of their engagement, independence and social relationships.

How will the child participate in daily classroom activities with his or her peers?

Early childhood classrooms have a schedule of regular daily routines, which usually consists of arrival, free play, snack, circle time, centers and so on. In order to plan how individual children will participate in daily routines and activities, programs can use routines-based assessment. This assessment is a functional method for determining what a child can do and what a child needs to learn in order to participate as independently and successfully as possible in daily routines.

Routines-based assessment involves interviewing a child's

regular caregivers (i.e., parents and teachers) to identify child independence, engagement, and social competence within each daily routine. The interview results in a list of functional goals that caregivers can address in daily routines.

Through a discussion of daily routines, adults identify what a child is able to do and what skills or behaviors he or she needs to learn to participate in the most daily activities.

The value of the routines-based assessment is three-fold.

Regular caregivers identify goals. Unlike formal assessments, when an unfamiliar adult decides what skills your child needs to work on, routines-based assessment relies on reports from the people who know the child best—his or her caregivers. The caregivers then understand the purpose of the goals and the anticipated benefits.

Goals are directly related to routines and enable children to be more independent and successful in their current environments. Goals are not just isolated skills drawn from a test or curriculum—skills that might be irrelevant to the child's daily life.

Few if any modifications are made to existing routines. These goals do not require an adult to spend extended periods working one-on-one with a child.

At the Individualizing Inclusion in Child Care model demonstration sites, the routines-based interview is used to identify goals for the child's individualized family service plan (IFSP) or individualized education plan (IEP). Even if a child care program is not familiar with this type of assessment, families can use the information about routines-based assessment to find out what programs do in order to plan for an individual with special needs in the classroom, or advocate for such an assessment to be used in planning for their child.

Ask the child care professional/ Observe in a classroom

- Are children interacting with peers, materials, or adults the majority of the time?
- Is independence fostered among children?
- What do the teachers do to promote children's social relationships?
- How do teachers identify and address children's individual needs in classroom routines?
- Did a professional from the center (e.g., classroom teacher, director) ask about the family's overall concerns for their child?
- What is the classroom schedule for the children in the child's age group?
- Will the child's teacher participate in the development of the child's IFSP/IEP? How can services be coordinated to ensure that all the professionals working with the child are working together?

There are numerous challenges to regular and effective communication among professionals. Lack of communication can cause duplication or gaps in services and inconsistencies in interventions. An integrated approach to therapy provides frequent opportunities for professionals across disciplines to communicate and coordinate services.

Integrated therapy is the provision of specialized services (e.g., physical therapy, occupational therapy, speech/language pathology, and special education) in the classroom within the context of daily routines. When therapy is provided in the classroom:

- four times as much communication takes place between the specialists and classroom teachers than when therapy is provided in a therapy room or other location;
- teachers get on-the-spot technical assistance and models by specialists;
- specialists see what children are and are not able to do in their natural environments;
- children get help with needed skills when and where they need it; and
- children generalize skills addressed in in-class therapy more than skills addressed in pull-out therapy.

Many specialists can provide therapy services in the child care setting. Families can tell service providers that they want therapy to be provided in their child's natural environment (one of which is the child care program). Teachers and specialists should determine which time of the day would be most appropriate for the specialist to come (e.g., if the SLP is going to work with Katie on using a communication board to interact with peers, she would not want to come at a time when the class is outside, doing water play). When specialists are in the classroom, teachers should try to be available to observe or talk with the specialists.

Ask the child care professional

- Do the teachers have experience working with specialists?

continued on page 50

continued from page 49

- Are specialists invited into the classroom to observe, provide therapy and consult with the teachers?
- Who will be responsible for giving information to and obtainingit from all professionals working with the child?
- What kinds of resources are available for the teachers?

Ask the specialists:

- Will they provide services in a child care classroom? Do they have experience working in classrooms?
- Are they willing to consult with child care providers about the child's needs and interventions? How will the child's developmental skills be addressed and extended to ensure that the child is reaching his or her full potential?

We know that children learn best when they are given multiple opportunities to practice skills across the day. By focusing on the skills a child needs to use in daily routines, caregivers are able to embed intervention strategies throughout the day, giving children many meaningful and relevant chances to practice. Embedded intervention is simply inserting intervention strategies into activities in which the child is engaged.

Ask the child care professional/ Observe in a classroom

- What is an example of something you are working on with a particular child?
- How do you work on this skill (e.g., isolated from other people versus with other people present)?
- What are the most important things you teach children? Hint: getting along with others, independence, fostering interests; not ABCs, numbers, and colors.
- Would individualized needs be addressed in one-on-one sessions or during the child's regular play routines?

When children have difficulty learning, how is this handled? Hint: One-on-one versus integrated into routines.

- About what percentage of the routines do teachers use to address individual needs?

For children with disabilities to have high-quality inclusive child care experiences, individual needs must be addressed in an individualized manner. The Individualizing Inclusion in Child Care project model has identified three key components for ensuring such experiences. The secret of successful inclusion, therefore, is a combination of:

- assessment about what really matters—routines;
- therapy and special instruction in the classroom with teachers involved; and
- special help woven into regular classroom routines. ■

Stacy Scott, M.Ed. is the project coordinator for the Individualizing Inclusion in Child Care model demonstration project, The University of North Carolina at Chapel Hill.

R.A. McWilliam, Ph.D. was a senior scientist at the FPG Child Development Institute at the time of writing. He is now at Vanderbilt University Medical Center.

STATEN ISLAND'S PS 37: A SCHOOL OF OPTIONS—

AND AN EXAMPLE OF HOW INCLUSION CAN WORK.

By Maria Tortoreto

Evelyn Phair Finn wants nothing more than to see her students excel. She knows each by name, and walks around the halls giving each a hug as they smile and laugh with her. As principal of Public School 37, A School of Options, Staten Island, NY, she has the highest regard for the future success of her students with disabilities. Inclusion programs are a great tool for this success.

Inclusion affords students with disabilities the chance to be in regular classrooms and interact socially and intellectually with general education students.

"Inclusion is a wonderful program," according to Staten Island Inclusion Facilitator Laura Towey. "It benefits not only the special needs students, but the general education students as well. By exposing them to each other, they get to learn and live with each other."

With many new early intervention programs in Staten Island getting under way, children with mild disabilities are able to get the extra attention that they need in pre-k and kindergarten, and eventually are able to move into regular schools in inclusion programs.

Towey has been working with Finn and the School of Options for ten years, finding and persuading regular districts to be open to the idea of inclusion. So far, the success of all students has been phenomenal.

Candidates for the inclusion program are chosen through parent or teacher requests. They are put into age-appropriate classrooms and work is adapted or modified to fit the ability level of the students, allowing them to be involved with the rest of the class.

No fewer than two special-needs children are put in one class, along with a SETS (Special Education Teacher Supports) professional. This person works directly with the teacher and the parents, as well as with the students, to keep everyone on the same page.

Says Towey, "Kids want to be like other kids, which is the best motivator for learning. Our students do things in inclusion programs that they'd never be able to do otherwise."

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

EDUCATION 2002

A TEST OF FAITH:

College Testing Services Will Stop Flagging Scores

By Julia Steele

In a move that will help students with disabilities, but may hurt the fairness of test administration, the College Board and ACT will no longer identify test scores obtained under special conditions. This will affect all College Board standardized tests, including the Scholastic Aptitude Test (SAT), the College-Level Examination Program (CLEP) and the Advanced Placement Program (AP), as well as the ACT college entrance exam.

"Special conditions" usually refers to extended time limits, but can also mean special computer set-ups, readers, scribes or other accommodations. The practice of identifying test scores obtained under such conditions is known as "flagging," and consists of including asterisks or the words "nonstandard administration" on score reports to alert college admissions offices and anyone else who may see the scores that accommodations were made.

The decision to discontinue flagging came after the case of Breimhorst v. Educational Testing Service (ETS), C-99-3387. The ETS is a nonprofit organization that develops and administers standardized tests. ETS tests include the Graduate Requirement Exam (GRE), Graduate Management Admissions Test (GMAT) and the Test of English as a Foreign Language (TOEFL), among others.

> Section 504 states that no "otherwise qualified individual with a disability" shall "be subjected to discrimination under any program or activity receiving federal financial assistance."

The case involved Mark Breimhorst, who in 1998 took the GMAT in preparation for applying to business school. Because he has no hands, Breimhorst was given permission to take the test on a computer with a trackball, as well as a 25-percent increase to the time limit. When his scores came back with the special conditions indicator included, Breimhorst called the ETS and requested that the notation be removed. They refused.

In July 1999, Disability Rights Advocates (DRA) of Oakland, CA filed a suit against the ETS on Breimhorst's behalf. They alleged that test score flagging is a violation of the Americans with Disabilities Act (ADA) as well as Section 504 of the Rehabilitation Act, since ETS receives federal funding. Section 504 states that no "otherwise qualified individual with a disability" shall "be subjected to discrimination under any program or activity receiving federal financial assistance." It was argued that flagging is a stigmatizing practice that constitutes discrimination. Organizational plaintiffs in the case included the International Dyslexia Association (IDA) and Californians for Disability Rights. The suit sought injunctive relief to end flagging, as well as compensatory, treble and punitive damages.

District Court Judge William Orrick, in the denial of an ETS motion to dismiss all charges, wrote, "If the testing provider complies fully with the requirement that its tests measure equally the abilities of disabled and nondisabled test takers, there would be no need for flagging."

Breimhorst and ETS reached a settlement in which ETS agreed to cease flagging on all ETS tests as of October 2001. While it is a separate entity from the College Board, the ETS develops and administers tests owned by the College Board, such as the SAT and AP. It was agreed that a panel would be convened to examine the practice of flagging on College Board tests. It is this panel which announced the recent decision that the College Board will no longer practice flagging on its tests as of October 1, 2003.

Following the College Board's decision, the ACT announced that it, too, would stop flagging as of fall 2003. While the SAT is the leading college entrance exam, the ACT is dominant in about 27 states, particularly in the Midwest. Most colleges will accept either test.

The decision to stop flagging is seen by disabilities activists as a considerable victory. But while most people

continued on page 54

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing can, even in a small way, change a child's way of life.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

Pull-Ups
GoodNites
DISPOSABLE ABSORBENT UNDERPANTS
45 lb & over

For Better Days

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus, they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Imagine your child gaining a little more independence just from a change in clothing. For information on how GoodNites can help, please visit us at www.goodnites.com/sn.

A TEST OF FAITH:

continued from page 52

involved agree that it's the right thing to do, many of them have concerns about how it will play out. Many feel that flagging served to help discourage those who don't really need special accommodations from abusing the system. Now, with nothing to suggest to colleges and others that extra time was taken or that other adjustments were made, many fear that there is no real motivation for students not to argue for exceptions if they possibly can.

There is also concern about how the disuse of flagging may widen the gap between students from affluent families and those from families without much money. Already, some families try to beat the system by pushing for a diagnosis for their child, hoping to buy them extra time on standardized tests. A recent study showed that students in private schools are four times more likely to receive accommodations during testing than students from public schools. With flagging gone, many fear that this disparity will become even more pronounced.

Both the College Board and the ACT plan to avoid abuse of the system by continuing the process of documentation reviews. Anyone who requests accommodations must have proper medical documentation to indicate the nature and functional limitations of their disability, as well as additional documentation stating exactly what accommodations are necessary. Often, test takers must receive accommodations when taking exams in school to qualify for accommodations on standardized tests.

Other common standardized tests not owned by ETS, ACT or the College Board still practice flagging. These include the Law School Admission Test (LSAT) and the Medical College Admission Test (MCAT). The DRA says they are receiving complaints about these exams as well. The end of flagging in general may not be too far off.

Meanwhile, testing services are left with the difficult task of determining how to make accommodations that will provide total fairness in administering tests to people with a variety of needs. It is relatively simple to provide someone who is blind with a test written in Braille. But exactly how much time will even the playing field for someone who is dyslexic, and what conditions are most appropriate for someone who has ADD or ADHD? These questions and more will become all the more important with the cessation of flagging. **EP**

NEW IMPROVED
QUICK-MIX FORMULA
DISSOLVES INSTANTLY. NO LUMPING.
To Life!

DIAFOODS THICK-IT brings the joy of eating back to people with swallowing problems.

Here's the solution for the millions of young and old who need modified consistencies to enjoy eating.

DIAFOODS THICK-IT, when mixed with hot or cold, thick or thin liquids and pureed foods, produces any desired consistency quickly, easily and controllably. But it does not change the taste or appearance of the food it thickens.

DIAFOODS THICK-IT adds sixteen calories per tablespoon for nourishment but is very low in sodium for people on sodium-restricted diets. And it helps hydrate patients because it will not bind water or fluids.

DIAFOODS THICK-IT is the market-maker and the #1 selling brand of Instant Food Thickener. It is recommended by speech and language pathologists, dietitians and nutritionists in hospitals, nursing homes and rehabilitation facilities across the country.

For product literature and advice, a free sample and information where **DIAFOODS THICK-IT** may be purchased, **call... (800) 333-0003.**

Free educational material, call... (800) 333-0003.

The booklet **"Dysphagia, A Review For Health Professionals"** discusses causes, evaluation and treatment of dysphagia.

The pamphlet **"Swallowing Problems"** helps patients and caregivers understand and adapt to dysphagia.

DD-SNAP

By J. Michael Hennike

Parents and families of children who have a developmental disability have all experienced the process of evaluations and assessments. The process has historically been conducted by a professional or team of professionals in the field of developmental disabilities ("DD professionals") using informal and formal assessment methodologies, including standardized assessment tools, structured interviews, etc. The assessment process has traditionally led to the acquisition of information designed to provide a diagnostic outcome or more often an assessment of the person's needs for services and support.

The assessment protocol that has typically been employed is a "professional-centered" one in which the person and the family are primarily respondents to the various tools and methods employed. Frequently, this process has as its focus the identification of deficits, limitations and dysfunctions of the individual being assessed. The recent advent of person-centered supports, self-determination and the empowerment of the individual, parents, and families has reduced the focus on deficits. Person-centered models have also created a more proactive, choice-driven system in terms of the supports a person requests and receives.

Despite the improvements in choice and the arrangements for acquiring support, the assessment of need for services and support remains primarily a "DD professional-based model." The process still entails the use of assessment tools for establishing eligibility for support and for determining a person's qualification for categories and levels of support. A professionally-conducted assessment of need for support does not, however, preclude an assessment of need by a person who has a disability, or by a parent or family member of a person with a developmental disability. In fact, this author would contend that a person/parent/family member assessment of need for support should be an integral part of a comprehensive needs assessment protocol.

The Developmental Disabilities Support Needs Assessment Profile (DD-SNAP) is a needs assessment instrument used by qualified DD professionals for determining acuity of level of need for persons with developmental disabilities. It is not deficit focused. It is focused on needs. This standardized assessment tool is used in a variety of states as a requisite part of support planning, eligibility and resource allocation.

The DD-SNAP provides, on a scale with five levels, need indexes in three important domains: daily living, health and behavior. From these three domains comes an overall level-of-need index, showing a range from low need (Level 1) to very high need (Level 5). This instrument has a structured, competency-based training requirement in order for DD professionals to be certified in its use. It is, nevertheless, a very straightforward, easy-to-use, self-scoring and easy-to-understand assessment tool.

The DD-SNAP will be used this year with 27,000 people in the North Carolina Developmental Disabilities service system as a first step in the development of an individual plan for support. The instrument also has an optional structure which can be used to aid in plan development. It is not a prescriptive tool in that it does not dictate a type of service or support, but instead it reveals the level of support required. The type of service selected to meet the need level becomes a matter of choice for the person, the family, and the support system.

The DD-SNAP protocol would be a very useful tool to be used in a parent-empowered assessment process. An assessment conducted by parents, guardians or close family members using the DD-SNAP would help structure and organize their knowledge of the individual's needs in important areas of life. The DD-SNAP assessment, when administered by parents or guardians, would facilitate the communication between support managers, brokers/providers and recipients of support. The use of this assessment tool by parents and families would also serve to empower them in their efforts to obtain necessary and desired supports.

The DD-SNAP training protocol and competency-based outcome model should be provided to parents of persons with a developmental disability who are interested in acquiring assessment skills. The training needed to meet the DD-SNAP competency requirements, if provided to parents, could equip them to meet the challenge of representing their best interests in arranging for support. In fact, around 150 parents and families in the state of Tennessee have already been trained to use the DD-SNAP as a self-assessment of need for support and services. These families did find a high level of congruence between their assessment and one completed by a trained DD professional. Where significant differences did exist between the DD-SNAP self-assessment by families and those conducted by professionals, the families were empowered to exercise the appeal prerogatives in a knowledgeable manner.

The DD-SNAP can also serve as an extremely useful tool for parents and families to periodically assess changes in the intensity of needs and the types of needs of their child or family member. Periodic assessment using the DD-SNAP to determine support needs can be an important monitoring device for families and can assist them in obtaining a review of the service array necessary to meet the recipient's needs.

In conclusion, it is important for parents and guardians to be empowered in the needs assessment process. This can be fostered by providing competency-based training that will equip them to conduct a formal assessment of need for their family member using the DD-SNAP. This assessment protocol will enable parents and families to effectively communicate needs for support with DD professionals. Whether the needs are daily living supports, health supports or behavioral supports, the parents/guardian will have a common frame of reference for measuring intensity of needs that is compatible with others responsible for providing supports and services. EP

Michael Hennike is the director of the Murdoch Center in Butner, NC. The Murdoch Center, in affiliation with the North Carolina Department of Health and Human Services, provides comprehensive residential care for developmentally disabled residents from sixteen counties in the North Central Region.

EDUCATION 2002

PARENT PERSPECTIVE

Homeschooling

In June 2002, EP asked our readers to tell us why they have chosen to homeschool their children with disabilities. Here are some of the answers we received.

THERESE AND MIKE COOPER

We will begin homeschooling our three-and-a-half-year-old daughter, who has Down syndrome, this fall. We have made this choice, for now, because we believe that knowing her best, we can impact her the most. She will not have to make the typical out-of-home school adjustments and will be able to enjoy the pleasure of learning. At home, I can be flexible to teach her when I know she is most receptive, and can more easily work with her medical needs. My husband can also be a part of her education journey. She will have the advantage of having teachers who know her for who she truly is, and not have to function under the treatment of a label. Her unseen potential is recognized and regarded as a real, life-giving component of her program to us. Just as each of her siblings, she will contribute her God-given gifts to her school environment and to the world. We are most interested in contacting other families who are homeschooling children whose abilities are challenged.

LEVERNIA@AOL.COM

I am the parent of a five-year-old little boy with CP. I decided to put him in homeschooling this fall. We live in a very rural area and the school system doesn't know where to begin or to end. The nearest place for my son to learn different opportunities is an hour away. We are still working on a program for my son. Right now our main subject is learning some type of communication. He is currently working on the Dynavox. This is been somewhat of a struggle for us. He has a hard time adjusting to new things and he also has such a strong determination, but we are not quite sure how to make him understand how to work with his body. As far as his teachers, who come out to help, they find it hard to learn the Dynavox or they just don't want to. My main reason for putting my son in homeschooling is because of the lack of technology the school has to offer, the ignorance of people caring for children like my son and the poor atmosphere they put him in.

Thank you for listening and caring.

DARLENE JENSON

Our son is now eight years old, and we have been homeschooling for two years. He has CP, mental retardation and a seizure disorder. We live in a small town in southern Vermont and our school options are limited. We received services from the Family, Infant, Toddler program when he was young, and then went on to the school district's Early Essential Education classroom (EEE). We requested an extra year in the EEE classroom, despite the fact that he was then six-years-old in the traditionally three- to five-year-old classroom. We strongly felt that he could (and did) benefit from remaining in the preschool-based curriculum rather than moving on to kindergarten. When the time came to make the decision to move him on to kindergarten, we again did not feel that he was ready for an academic-focused curriculum, as he was only just beginning to understand and respond to a more play-based, preschool program.

All this raised the question of developmentally appropriate curricula. For typical children, this means a curriculum based on their developmental age in relation to their learning styles, and the development of their social and cognitive skills. There are many educational theories for designing a curriculum based on a child's developmental needs. In our school district the educational norm for special education is to integrate the special ed students by keeping them with their chronological peers. This presented a problem for us right from the start, as our son's developmental age is closer to a preschooler and may remain that way for who knows how long. We imagined that our child might do okay in kindergarten, but what about when he's in fourth grade, sixth

continued from page 58

grade and beyond? Sure, there is a special education "classroom," but mostly the children work with their one-to-one aides on their IEP goals. Our child is very social, very musical and very expressive even though he is non-speaking. The idea of him spending most of the day with one adult did not appeal to us. Our thoughts turned to home schooling.

What a huge undertaking, we thought! What about socialization? Would it be enough for him? Would we be too isolated? Many questions came to us, but then we started to get excited about creating a school situation for him that was really about him and his developmental needs, not about trying to fit him into an existing system.

We called a local home child care provider and asked her if she would be willing to have our son in her program. She was very excited about this idea, and after meeting many times to explore the details we decided to take the leap into this new world of home schooling. We would be our son's aides as he attended her home child care program three mornings per week. There would be a small number of children; she would be in control of designing the curriculum and we would be right there to work along with her and our son. This was the answer for us: a way we could create a program for our son that met his developmental needs and allow us to remain in compliance with the school district's laws.

We registered with the Dept. of Education Home Study office and received lots of help putting our son's IEP goals into the correct educational categories, like science, social studies, government and literature. It was pretty overwhelming at first, but got much easier as the year progressed. Our son's whole curriculum is based on his own personal needs in relation to the physical, speech, occupational and social skills that he needs to work on. These curriculum goals came from his IEP, his private therapist's goals, his child care provider's goals and our family's goals for him based on what we all know he really likes and what he wants and needs to accomplish next.

Our first year went well. There were lots of details to work out and we all got a sense of what it really meant to "integrate" a special needs child with typical children. It is a difficult task and takes lots of patience, trust and role modeling on the part of the adults. Our son had a good year; he was exposed to many new situations, he learned lots of new social skills and he loved the play-based curriculum. We also met lots of other home schooling families through another group we participated in one day per week.

Our second year we increased his time and hired an aide to

Positive lifestyles
for people with developmental disabilities.

Residential, vocational and day programs are provided in a rural village setting. Residents enjoy community living, and a lifestyle designed to appreciate their individual characteristics. Respite care is also available.

attend the home child care program with him so he could have a more independent experience. This worked very well and increased his opportunity for child-to-child interactions and involvement. Each year we expand the curriculum to fit the goals that he is actually working on. Sometimes that means that a goal we chose did not get fulfilled, but another goal took on more emphasis because he was developmentally ready to move in that new direction. Because we (including our son) are in charge of his learning and setting the goals we are free to be flexible and current with what he needs and wants to be working on. This is developmentally appropriate curriculum working at its best.

All in all, it has been a great experience for our family. We still have lots of questions and wonder if we are doing "enough," but the smile on his face when his aide rings the door bell, the way the children greet him with "his" sounds at the birthday party, and the way his peers take hold of his hand to give him hand-over-hand assistance to play with a toy is enough for us. Oh, and what about the quality of life issue? Well, I think for our son, making friends and making music, having new experiences and teaching others to embrace the simple pleasures in life is what having a good quality of life is all about. **EP**

National Association of Private Special Education Centers

NAPSEC is a nonprofit association whose mission is to ensure access for individuals to private special education as a vital component of the continuum of appropriate placements and services in American education.

Free Referral Service
NAPSEC provides information on potential placement options to parents and professionals who need an appropriate private special education and/or therapeutic setting.

National Representation
NAPSEC advocates for the rights of individuals with disabilities and their families.

Nationwide Membership
NAPSEC represents private special education facilities throughout the US by providing a wide array of membership services.

401 KID

by Julia Steele

New tax laws are providing families with better ways to save for college. With tuition costs increasing at more than twice the rate of inflation, more and more parents are wondering how they will be able to afford higher education for their children. But thanks to recent changes in IRS code, new options are available.

Tax legislation called Section 529, passed about five years ago, is to higher education what a 401k plan is to retirement. Even though it has been around for a while, only 25 percent of parents are aware that it exists; 75 percent are missing out. This law allows for investments in "529 Qualified Tuition Plans" (QTPs) to grow 100-percent federally tax-free, and often state tax-free, provided that the funds are used for Qualified Higher Education Expenses.

While they do vary a bit from state to state, most 529 plans offer minimum investments as low as $25 and have generous contribution limits—over $250,000 in some cases. There can be other benefits as well, such as employer matching contributions. Since they are relatively new, 529 plan laws are still in flux and have a tendency to change rapidly, so be sure to find out what the rules are in your particular area.

401Kid®
Education Savings Plan

Certain restrictions prevent some upper-income families from participating, but anyone making less than $220,000 a year may open a Coverdell ESA, and may contribute up to $2000 a year. Typically, the account must be withdrawn by the time a child is 30 years old, but an exception to this rule is made for children with disabilities.

Another way to save on educational expenses is with Coverdell Education Savings Accounts (ESAs), formerly known as Education IRAs. Coverdell ESAs have been made tax deductible for education expenses in the K-12 years, including books, room and board, tuition and transportation. Unlike 529 plans, which are mostly handled by private investment companies, Coverdell ESAs can be opened through almost any bank.

Certain restrictions prevent some upper-income families from participating, but anyone making less than $220,000 a year may open a Coverdell ESA, and may contribute up to $2000 a year. Typically, the account must be withdrawn by the time a child is 30 years old, but an exception to this rule is made for children with disabilities.

In addition to the absence of a time limit on the funds, there are other for children with disabilities. For instance, certain tax credits may be taken for child and dependent care expenses. For parents with a dependent child going to college, the costs incurred are entirely tax deductible. This is not the case for non-disabled children. One thing to note, however, is that both 529 plans and Coverdell ESAs will affect a family's Expected Family Contribution when applying for financial aide.

There is a lot of information out there about these options, and sometimes it can all get a little bit confusing. A web site called 401kid (www.401kid.com) provides information about 529 plans and Coverdell ESAs and helps to break down the information. It also provides ratings based on relevant criteria, such as contribution ranges, plan expenses and tax benefits. While the site requires membership in order to gain access to most of its material, it does offer a basic membership for free. The site contains information for everyone from parents and students to educators, employers and fund managers. 401kid also offers various financial calculators and software packages, as well as consulting on a number of topics.

The key to making education more affordable is to start saving early, while children are still young. But through these options, parents now have better ways to make higher learning more financially accessible to their children. EP

Who will care for your disabled child when you are gone?

Litigators Incorporated, P.C. & Affiliated Law Firms

ATTORNEYS ACROSS THE NATION

Dear Parents:

My sister died leaving behind a disabled child. If you have a child with a disability, the obligation for his or her care continues even after you are gone. My name is Jeff Brody, President of Litigators Incorporated, P.C. Let us help you find out if your child's disability was preventable; you could be entitled to substantial compensation for the lifetime care of your child. You owe it to your child to protect their future. There are time limits, please call me

EDUCATION 2002

THE PARAEDUCATOR paradox

by Patricia H. Mueller, EdD

Somewhere along the line something went wrong. Special education has become a system that depends heavily on relatively untrained, underpaid, and devalued staff members to provide instruction to our most challenging students. That is what I call the "paraeducator paradox."

The following is a brief description of some of the larger issues and growing concerns that surround the employment, training, retention and support of paraeducators, and a list of steps that parents can take to help improve the situation. The ideas presented come from research; many are from the numerous paraeducators with whom I've worked over the past ten years. My hat goes off to those dedicated professionals!

ISSUES AND CONCERNS

Inadequate orientation and professional development

Paraeducators aren't "aides" anymore, running the ditto machine and performing clerical tasks. They spend most of their time providing instruction, and many report that they independently plan instruction for students. However, most paraeducators also report that they receive little or no training to perform these roles. Most training occurs on the job or from another paraeducator. If they do receive orientation training, the focus is typically on confidentiality, while many other important topics—orientation to the classroom and students, reporting suspected abuse or neglect, home/school communication—are not discussed.

If paraeducators are paid to attend the district in-service workshops, they often report that the topics are irrelevant. They also report inconsistencies in payment to attend either in-district or out-of-district in-service, thus decreasing their ability to access training opportunities.

Role Confusion from absence of a clear job description

Paraeducators frequently laugh when asked if they have job descriptions; many have none. If they do, most are out-of-date and no longer reflect the current role of the paraeducator. Many written descriptions add the phrase, "and all other duties as assigned by the supervisor (teacher, principal)." Paraeducators have often reported that they have been assigned tasks for which they felt they were not qualified, but obligated to perform. The effect of these practices is role confusion about who does what, when and with whom.

Poor supervision and lack of ongoing support

Many paraeducators indicate having little contact with supervising special and general educators. They are rarely observed and provided with corrective feedback. What support they do receive is from other paraeducators. As a result, they often feel isolated and alone.

Inadequate performance evaluation

I think this quote from a Vermont paraeducator sums it up: "In the nine years I worked in this district, I have received two evaluations!" Paraeducators often report that they are evaluated infrequently and that, on those rare occasions, the evaluations are often conducted by administrators who are unfamiliar with the paraeducators' work, thus making the reviews irrelevant.

Lack of respect as an educational community member

Paraeducators continue to feel that they are the lowest on the totem pole. These feelings are certainly substantiated by poor salaries and benefits, a combination which causes many to leave the profession. Paraeducators across the country report that they do not feel they are respected or valued for their contributions, as so eloquently expressed by a Vermont paraeducator:

"The rewards to be had in doing this are from the kids. In the school where I work, paras are still thought of as housewives with part time jobs… We never know what is going on, but are expected to implement decisions that we are never a part of. As far as the pay goes, there is no differential for education or job performance. If you are one of the capable paras, you are asked to do more and more classroom teaching without any additional pay. If you love the kids and are

WHAT'S WRONG WITH THIS PICTURE?

hooked on the learning process, the administration gets an extra teacher in the bargain. Recognition is pretty much lacking. If it were not for the parents and their children, paras would go pretty much unnoticed."

Overuse of paraeducators (the Band-Aid approach)

Assignment of paraeducators as the one and only method to support students in general education programs has skyrocketed (check your local school budget increases in the area of personnel). Paraeducators certainly do provide the support some students need, but they can also hinder a student's growth. For example, when a paraeducator becomes "Velcroed" to a student, the student's social interactions with peers can be significantly affected. Similarly, when a paraeducator becomes the student's primary teacher, the general educator abdicates responsibility for the student, further isolating the student. In such instances, the paraeducator may lack the necessary qualifications and training to effectively implement instructional and behavioral programs. As a result the student may not develop peer relationships or receive quality instruction. These situations illustrate what I refer to as "irresponsible" inclusion.

PROMISING PRACTICES

By now you have probably identified practices that may be in use in your child's district. Here are some proposed changes that can ultimately affect the quality of your child's education.

Cartoon appearing on this page reprinted with permission from
"Teaching Old Logs New Tricks: More Absurdities and Realities of Education"
by Michael F. Giangreco
©2000, Peytral Publications, Minnetonka, MN.

When possible, participate in the hiring process

Speak with your district administrator and ask to be a member of the hiring team. You may know the best "fit" (personality type) for your child. As a former district administrator, I know this participation may not always be possible, but your input can assist in the hiring, orientation training and ongoing relationship you will have with the paraeducator providing support to your child.

Develop comprehensive job descriptions

With input from paraeducators and other key staff, recommend to district administrators that they develop job descriptions that include qualifications needed for the position. These should include orientation and training requirements for the position, duties and responsibilities of the position and guidelines for supervision, ongoing support and evaluation. Model job descriptions do exist in various districts throughout the country.

Relevant orientation and professional development

Encourage your district to provide an orientation that includes a review of the district's/school's policies and procedures and orients the paraeducator to your child, the classroom and other staff that support your child. You may want to participate in this orientation effort, since you have valuable information about your child's learning style.

Paraeducators should help to build relevant professional-development programs that meet their unique needs. Some districts have created successful mentoring programs in which trained, veteran paraeducators mentor the "new kids on the block." Others have flexible in-house mechanisms for paraeducators to earn credit for the on-the-job training they receive. Work with your State Department of Education and institutions of higher education to develop appropriate training for paraeducators. Funding these initiatives is not as difficult as it may seem; many districts can access their professional-development funds or state/federal grant funds.

Adequate supervision and ongoing support

Special and general educators who supervise paraeducators need their own professional development program that describes how to best utilize these fellow teachers. Most have never received this information through their pre-service or in-service training programs. An excellent resource book, "Supervising Paraeducators in School Settings: A Team Approach" (A.L. Pickett and K. Gerlach, Eds, Austin, TX, 1997) can help your district to develop a strong staff training program. The National Research Center for Paraprofessionals in Education and Related Services provides training and technical assistance, disseminates information about promis-

PARADOX

continued from page 65

ing practices in the field, conducts research and develops policy related to paraeducator issues and concerns.

Develop an appropriate evaluation system

Suggest linking the job description to the evaluation system, including professional goal setting, so paraeducators can determine how they want to grow during the year. Recommend that those educators who know the work of the paraeducator complete the evaluation, rather than an administrator or supervisor who lacks specific knowledge about the paraeducator's work.

Value the paraeducator as a part of the team

Acknowledging paraeducators for what they do can range from small things such as using the title "paraeducator" to increasing salaries and improving benefits. Paraeducators appreciate it when their input is recognized and valued, such as through participation in IEP meetings. Encourage teachers to value paraeducators as true team members. Help to educate community and school board members about the importance of these staff members. Suggest creating a committee made up of staff and community members to brainstorm cost-effective ways to celebrate paraeducator accomplishments.

Develop a process for determining when and if paraeducator support is necessary

One of my colleagues has developed a three-step team process to determine whether a student requires paraeducator support. The process identifies: 1) the specific student needs, such as safety; 2) what the student can and cannot do and the extent to which s/he needs assistance during the course of the day; and 3) where, when and how the paraeducator will provide support or encourage independence. Implementation of a process such as this ensures that students receive the level of support they need. It also encourages teams to actively discuss how peers will interact with the student, and how gradual independence will occur to the greatest extent possible. As parents, it's important to understand that assigning a paraeducator to support your child 100 percent of the day may not be of benefit.

Review staffing assignments

Districts that assign paraeducators to classrooms and/or to teachers, not to individual students, help to avoid the "Velcro effect." Assigning paraeducators to work with a variety of students and developing job-share positions for students with intensive needs are strategies that deal with student dependency issues and help reduce paraeducator burnout.

I hope this article has given you the opportunity to think about some of the challenges facing you and your school system in the hiring, employment, deployment, training, support and evaluation of the paraeducators who are probably providing significant levels of direct instruction to your child. The "promising practices" described are a reality in schools across the country. If you work collaboratively with your district to develop comprehensive processes and strategies that will support your children, they will be as successful as you know they can be. Readers can contact me for models, resources and/or references. There's a lot out there, so the wheel doesn't need to be reinvented. EP

For nine years, Dr. Pat Mueller coordinated the University of Vermont's Certificate of Study Program for Paraeducators that prepared paraeducators to work in inclusive schools and community settings. Dr. Mueller is the President of Evergreen Educational Consulting, a consulting firm in Vermont that provides professional development and technical assistance to state Departments of Education, local school districts and other agencies interested in developing qualified and dedicated educational support teams.

The author would like to thank Fran Campbell and Joyce Brabazon of Parent to Parent of Vermont for their thoughtful editorial reviews and comments.

Toolbox of Hope

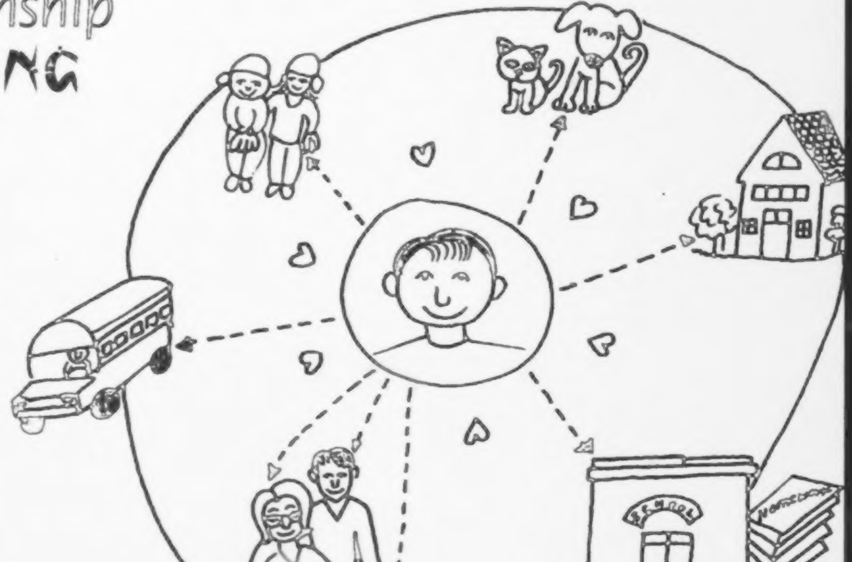
All children suffering from chronic, degenerative or terminal illnesses can benefit from using Toolbox of Hope, a workbook for kids. Created by Deva Joy Gouss, who has rheumatoid arthritis, this unique book is designed to help children come to terms with their diseases. Parents and teachers can use the activity outlines to help them and their children understand the feelings of confusion kids deal with every day.

For more information, visit the website at http://www.toolboxofhope.com.

THINK ABOUT IT!

You have a relationship with EVERYTHING in your life!

This includes your family members, friends, pets, all other animals, school subjects, activities, sports, your home, your school, your teacher, your parents' car or the bus you ride. The list can go on and on. Call upon the friend in you! Get personal with everything in your life!



1044

There are four rules of thumb when it comes to the importance of feelings! Here they are:

1. It is important to know how you feel! Name your feelings!

2. It is important to give yourself permission to feel whatever you feel!

3. It is important to express your feelings in safe ways!

4. It is important to think good thoughts and do good things for yourself - you deserve it!

SADNESS:

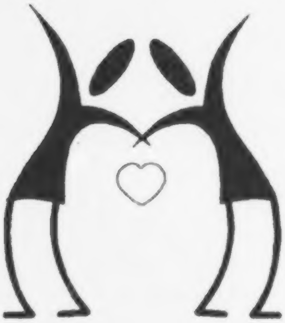
When you feel sad, it's very important to feel comforted and loved. Love heals!

Here are some special tools for you to use when you feel sad:

Curl up with your favorite blanket, stuffed animal, doll, or your pet. Find anything that you feel especially close to and have a good snuggle!

JOY:

Joy and happiness are just as important to feel and express as the more difficult feelings. Let yourself dance and move with the good feelings in your body.



Share your joy and love with other people and animals. Give and receive hugs!

Roll in the grass! Smell the flowers! Look up into the sky, throw your arms out and breathe, sing, dance, twirl! Be joyous!

Do some of your favorite things!

Make gifts for the people you love!

WOW!

All this joy, gratitude and self-appreciation!

We are already into the fourth rule of thumb for expressing feelings:

Think good thoughts and do good things for yourself!

REVIEW OF THE TOOLS:

- Share your story
- Gather information
- Create a relationship with your illness
- Name, give permission to and express your feelings
- Think good thoughts and do good things for yourself
- Learn to meditate, be grateful and find peace
- Think about "The Bigger Picture"

Bravekids.org is one of the three programs offered by the non-profit organization Brave Kids, founded by Kristen Fitzgerald, who suffered the loss of two children to catastrophic illness. Through bravekids.org she is successfully helping others to prevent similar situations.

The website provides children who have chronic, life-threatening illnesses or disabilities with knowledge and information that can aid them in their daily experiences.

The site includes:

- Message boards that offer children and parents from around the world a place to connect with one another, lend support and share common situations;
- A Directory of Healthcare Resources which enables parents and caretakers to easily locate the nearest healthcare resources needed for ill children;
- The most recent and accurate medical information for children and family members presented in an interactive format geared towards providing the information in a fun and relateable fashion; and
- Interactive games and contests for children with special needs that offer winners wonderful prizes and the opportunity to be featured on the website and in the Brave Kids newsletter.

The web resource for kids with chronic or life-threatening illnesses

BraveKids.org

Club Bravekids is also included on the site. It offers children with special needs the chance to join an online club where they can vote on weekly polls, participate in games with one another, join various contests, utilize message boards, read news about other Brave Kids and research medical information that is created just for kids and teens.

Bravekids.org is easy to navigate and extremely dedicated to catering to the needs of children with disabilities and their parents. The opening page presents the Research Directory Search that offers information on everything from camps and clothing to respite care and transportation, all listed alphabetically. With the simple click of a mouse, those interested are immediately provided with a wealth of data on a particular topic. The search can also be specialized if a specific disease or condition is selected and the postal zip code entered.

Bravekids.org

Overall, bravekids.org is a web site that was designed for children with special needs and is thorough in its dedication to that cause. Every element of the site supports the mission of Brave Kids: to help children with chronic, life-threatening illnesses or disabilities. EP

Do you or someone you know have ADHD?

If you or someone you know experiences one or more of the following challenges often displayed by those who have ADHD, you may be interested in a breakthrough technology program called Interactive Metronome® (IM).

_ **Poor Coordination**

_ **Difficulty focusing/concentrating**

_ **Difficulty with language processing**

_ **Difficulty with reading fluency**

_ **Aggressive behavior**

Findings from a double blind, placebo controlled study on subjects diagnosed with ADHD showed those who completed the IM program saw improvements in attention, coordination, control of aggression, reading and language processing. This study was peer reviewed and published in the *American Journal of Occupational Therapy*.

Interactive Metronome is a non-invasive software program proven to produce significant gains in all of the above areas in just 3-5 weeks. This innovative technology program is available through your local health-care provider. To find an IM provider in your area, log onto www.interactivemetronome.com.

They Have A Lot to Say...

and you can be the one to help them say it.

Since 1983, DynaVox Systems has been committed to helping individuals with speech, language and learning disabilities to lead fuller, more independent lives.

Our products are a part of a broad group of communication methods called *augmentative and alternative communication*, or AAC. DynaVox AAC devices help thousands of young people with speech disabilities due to cerebral palsy, autism, mental retardation and Down's syndrome to express themselves.

As the AAC industry leader, our success is based on a strong partnership with our customers. Our foremost objective is to ensure that our customers receive the best solutions to meet their immediate and long-term communication needs. This is enhanced by a comprehensive network of support services including:

- ***Funding Assistance***
- ***Product Training and Support***
- ***Expert Field Support***
- ***Telephone Customer Support***

All DynaVox associates are committed to the development of innovative services. Together we can achieve our goal as we continue to improve the lives of individuals with speech disabilities by bringing them the power of communication.

Special Report | Part IV: Family Wellness, Quality of Life and The Long View

by Susan Carucio Colacello

Long before our children are born, we envision who they will be, what great things they will do and how they will take the best of us and become even better. We risk facing our own mortality to peek into a future beyond our time, imagining their families, accomplishments, and contributions. They are the legacy we leave behind.

When our children do come along, we are well practiced at seeing the long view through our imagination. The challenge for all parents is to reconcile this imagined vision with the personalities, strengths and challenges of our real children. This can be exceptionally difficult when those children have disabilities and require unique supports and accommodations in order to access opportunities to learn, grow, work and live fulfilling lives.

> **"Vision...The ability to see beyond our present reality, to create, to invent what does not yet exist, to become what we not yet are. It gives us the capacity to live out of our imagination instead of our memory."**
>
> ***—Steven Covey, First Things First***

The first three articles in this series discussed parents' experiences and emotions as they move through the early years of raising, educating and securing medical care for their children with disabilities. Here we will look at the necessity of establishing a vision, or long view, that balances the parents' concern for safety with the adult child's need for independence, socialization and right to a productive and self-fulfilling life. Families who have found their children successful living and working placements agree that, although the process may be painful at times, it is immeasurably rewarding.

"The Vision Thing"

Valuable resources for parents ready to develop a vision and plan for the future can be found at kidstogether.org, a Pennsylvania-based advocacy web site developed by Colleen F. Tomko and her colleagues. They have put together a wealth of material to take parents through the process step by step. Ms Tomko suggests, "One way to start…is to begin thinking about where you and

continued from page 72

your child desire to and desire not to live, work and spend leisure time as an adult." Look ahead and imagine what your child will enjoy doing, who his or her friends will be, where they will go on vacations and who will make it possible for them to get to those places. It is important not to limit your vision to what other children with similar disabilities are doing, or what people are telling you is possible or likely to happen. "Once you have a dream, you can begin working toward getting the things your child needs," says Tomko. "Let not our needs determine our dreams…but let our dreams determine our needs."

Nancy McElroy is the mother of two daughters with different disabilities. Heather is 31 and has cerebral palsy (CP) and spastic quadriplegia and Shannon, 32, has Down syndrome. Both women live outside the McElroy home and planning for each one was unique. "For us it was obvious that they would need different living arrangements, that one could function and interact completely and independently and the other could not," says Nancy. The McElroys recall when they began to realize that Heather might need more support and care than they could offer her at home. "We took family vacations every year," she explained. "The summer when she was 15, we couldn't get her to the ocean. She was so heavy and there was so much equipment. We had to keep her in the cabana the whole time. Then, one evening, we were giving her a bath, it took both of us, and she began to stiffen up and we almost lost her." Nancy said that it was her school district that approached them and suggested they find a place that could help. The McElroys worked with their district to develop an IEP for Heather and to find a school that could offer her the supports, assistive technologies and other learning tools to address her unique mobility, communication and education needs. She was placed at The Center for Discovery.

The Center for
DISCOVERY

A recent NICHCY report, "Parenting A Child With Special Needs: A Guide to Readings and Resources," states, "it is not possible for parents to imagine all the stops and detours that they will make as their unexpected journey takes them into the future. Advocates believe it is important for parents to have expectations about what their child with disabilities can achieve in the future and to encourage their child to develop as much independence as possible." Once high but realistic expectations are set, each family must consider many factors to determine the best place for the child to develop and practice skills for independent living.

Ellen and Jack Orlando are parents of two girls. Nora, the younger, has Rett syndrome; when she was 15-years-old she was placed residentially at The Center for Discovery in Harris, NY. "The first few weeks were very difficult, but the school was so adept at understanding what we were going through," says Ellen. "Nora adjusted much more rapidly because it was the right thing for her." The Orlandos were able to make the decision about residential placement for Nora without feelings of guilt, because they realized that resources at home would no longer be available to maintain the same high quality of life they had been able to offer her up to that point, "When both children were young, the difference in their abilities and their daily routines was hardly noticeable. But as Sara, our older daughter, matured and Nora grew it became more difficult to balance each one's needs." Like other parents of children with physical disabilities, the Orlandos were faced with the challenge of transporting Nora. "Though friends and family were very supportive, we couldn't ask for much help after Nora moved into early childhood. She was just too big and people weren't comfortable tending to her needs," Ellen explained. A final factor in the Orlandos' decision was that of control. "We wanted to be the ones making the decisions for Nora. Everyone in the family loves her, but not like us."

Planning for the long view is a process of continual change where parents work diligently to find a balance between family wellness and the stresses and battles of securing rich and loving environments in which their child with disabilities can thrive. Dennis Raymond, Admissions Director for The Center for Discovery, a comprehensive center in Harris, NY serving people with disabilities, urges parents to "be prepared to do whatever is necessary to create a placement that best serves the needs of the child and the family. Parents will have to do research, advocacy and may even have to take the legal route. When the child is placed in the right setting, the whole family can thrive."

"It is about finding balance for the entire family," says Joan Kandler, mother of 32-year-old Susan, who was diagnosed with brain damage when she was 8 months old. "Primary caregivers have

Parenting Suggestions

"Becoming a parent for the first time changes our identity forever," says Dr. Robert Naseef, psychologist and author of Special Children, Challenged Parents. "There is a balancing act between caring for the needs of children and putting time and effort into maintenance and growth of ourselves and our relationships. This transition in the development of family life is challenged even further by disability or chronic illness." Here are some of his suggestions for couples who are parenting a child with special needs.

- Communication is key. Resist the tendency to blame; ask for what you need and listen to what your partner needs.
- Add some fun to your life, alone and with your partner. If you worry about leaving your kids, take a beeper or cell phone.
- It helps to be as active as you are comfortable being, in the community as a whole and in the special-needs community in particular.
- Exercise. Almost any form of exercise will lift your spirits if you do something you enjoy and do it regularly.
- Keep a journal. Writing down thoughts, feelings and experiences is helpful in putting things into perspective.
- Support groups. It is often helpful to share experiences, thoughts and feelings with others who are in the same boat and can understand.
- Break problems down into more manageable pieces.
- Remember that you and your partner are both on the same parenting team, not competing.
- Seek professional guidance when necessary. It is not a sign of weakness to seek help. It is wise to think of your needs as well as those of your children.
- Keep in mind that a hard life can still be a good life!

an intuitive sense of when it gets terribly out of sync; you know it and you begin to plan for the next step. When you are doing everything you can, using all the public and private resources available, and the primary caretaker is exhausted, the other children become very demanding of attention, and the child with the disability is not progressing, that's when you know that love is not enough." Joan recalls that she had to "fight tooth and nail" with her husband before he would consider a residential placement for Susan. "His fear was that she would forget us, she wouldn't know her family anymore."

Joan and her husband had months of discussion until they both felt comfortable and agreed on the type of placement they would seek out for Susan. "We wanted a place that was as much like a home as possible, where they would be a family unit and have values similar to ours. We talked and looked for more than a year. Sarah was rejected from several programs owing to the complexity of her disabilities. We finally found a wonderful program, and everything fell back into balance. I would get a sitter for the other kids and I'd visit Susan. I even got a job there so I could see her. The other children would go up and have sleepovers with their sister. It was very friendly and very family-focused."

From Vision to Reality

For many parents, the fears and concern for their vulnerable child are overwhelming, and can prevent parents from taking the basic steps to plan for the future. Special-needs attorney Herb Hinkle of Lawrenceville, NJ states, "There are some things families can control and many they cannot. Often they become paralyzed by the things they cannot control and fail to take care of those they can." Mr. Hinkle likens the process to his experience going back to school for tax law: "There were 600 codes I had to learn; it seemed endless and impossible, but once I got through those that was it, no more." Putting financial and legal papers in order seems like an insurmountable task, but once it's done, it's done. Mr. Hinkle urges families to "stay plugged in" by going to meetings, talking with as many parents as possible, and accessing resources and publications that offer up-to-date information.

There are a few basic steps you can take to ensure your child's quality of life in the future. "I see two distinct issues," says Larry Greenstein, father of a child with disabilities and a CPA in Long Island, NY, "setting up a financial plan and finding a good program for those finances to fund. You have to find a model you like and people you can trust. You visit the places. In some cases you can get a group of parents together and get a house for the kids. There are so many options. My son is only 10; we don't know where he will be at 18 or 20. We operate under the assumption that all the intensive therapies we are doing will get him to a point where he will function on his own. We are on lists for group homes, as some of the waits can be 10 years. If we need it, it is there," Mr. Greenstein explains."

Write A Will and Establish Guardianship

Whether or not you parent a child with a disability, you should have a will that establishes guardianship for your children in the event of your death. In the absence of a will, a judge decides who is best to care for your children. At the age of majority (18 in most states), parents must petition the court to be named as guardians for their children who are deemed legally incompetent. Parents can include siblings and other family members or friends as co-guardians.

Create A Special Needs Trust

Become knowledgeable about the laws and eligibility requirements for the federal and state programs their children will be entitled to as adults. Both Social Security and Medicaid are means tested and requirements change from state to state. If the individual has more than a specified amount of money in his/her name, they can be deemed ineligible for benefits.

continued on page 76

BEST COPY AVAILABLE

continued from page 75

Law currently allows for a Special Needs Trust to protect individuals with disability from risking ineligibility. The trust gives trustees the right to pay for any expenses their children might incur, other than those things covered by the government agencies. The trust prevents monies from flowing through the child in any way, preserving eligibility. All family members and friends should be made aware of the trust so that money is not gifted to the individual. Parents need not avoid setting up a trust because they have no money to fund it. Most trusts are funded by insurance policies that have the child named as beneficiary and are not funded during the parent's lifetime. (See also "Special Needs Trusts" on the Financial Planning page of www.eparent.com.)

Keep Informed

According to Herbert D. Hinkle, who has represented people with disabilities and their families since 1974, parents often overestimate the resources necessary to secure a good quality of life for their adult children with disabilities; this can lead to paralysis. "The more you know, the easier it is," he says. The first, and most important aspect in planning a trust is to remove the economic obstacles that prevent siblings or other family members from being involved. The trust will also specify how money can be spent. It provides for airfare and other expenses to bring the siblings together if they live apart. It can also pay for someone to be the "eyes and ears" and to check up regularly on the individual. In order to set up a plan, you need to be familiar with the laws in your state. Parents should find a good attorney who specializes in disability law and a tax accountant who knows special-needs tax law. A good place to start is with your local ARC, Developmental Disabilities Council or advocacy organizations to obtain referrals.

Begin Transition Planning Early and Be Informed About What's Available

All students receiving special education services under the Individuals with Disabilities Education Act, IDEA, are entitled to transition services beginning at age 14. These services are defined as "a coordinated set of activities for a student, designed within an outcome-oriented process, which promotes movement from school to post-school activities." These activities include "instruction, related services, community experiences, the development of employment and other post-school adult living objectives and if appropriate, acquisition of daily living skills and functional vocational evaluation."

Become familiar with this law and the Americans with Disabilities Act (ADA), so you can best advocate for your child. Know when your child will age out of each educational placement and be prepared to push the school and other agencies involved if needed. If your child is 14 and a transition plan is not part of his or her IEP, contact your child study team and the state and community organizations involved with adult and vocational services in your area to create one.

Planning For Independence

When you are developing goals to make your vision a reality for your child consider the following:

- create opportunities for your child to acquire skills now that will make him independent in the future;
- ensure that your child has opportunities to develop social skills that can be used in many settings;
- teach your child to be responsible for personal needs and self-care; and
- encourage your child to develop and practice self-determination and self-advocacy skills. At some point, your child will be his or her own best advocate.

The Dignity of Risk

"There is always a risk in having someone else take care of a loved one, but there is risk in everyone's lives," says Paul Prior, whose brother has autism and is non-communicative. "People with disabilities have the right to experience risk, as well as the rewards that come with it. My brother is placed in a group home and there is risk there, but David has developed skills he had never had. He can sign for food, water, the bathroom and he makes eye contact. We did a great deal of planning and we were able to line up very good adult services. He is more independent now than he has ever been."

continued on page 78

The National Council on Independent Living

When searching for an adult placement for your child, a great place to start is The National Council on Independent Living. There are 160 independent living centers across the US. The centers offer information and referral services, independent living skills training, peer counseling and advocacy. Colleen and Max Starkloff run Paraquad, an ILC in St. Louis, MO. Colleen writes, "Independent living centers were established to change the way our society thinks about and reacts to people with disabilities. Independent living means having control over one's life and making decisions and choices about how one lives based on a reasonable framework of options." The NCIL can answer your questions and refer you to a center in your area.

Mr. Prior, who is now a special-needs attorney and family advocate in Lawrenceville, NJ, looks back on his childhood with his brother. "My parents did their best to protect me from the burden of having to care for him. It is absolutely not a burden and it doesn't take as much of your life as you think. It is important for siblings to know that they are not going to literally be their brother or sister's keeper. There will be no need for the person with a disability to live in a siblings home or be supported financially by the sibling. If you plan properly there is money and a place for the person with a disability to live."

The family members quoted here all agree on one point: that the supports provided by independent-living and residential centers make it possible for their family members to participate much more fully in their community than they would be able to if at home. The McElroys are certain that both their daughters have much more enriching lives being on their own. As Nancy explains, "The biggest thing we've given them is a sense of self...they would not have had that at home with us."

Although the Orlandos believe that a dependable respite program might have allowed them to keep Nora home for awhile longer, they believe that all children need to be off on their own. "Who wants to stay at home all their life?" Ellen asks. "Our typical children spend time picking the right college; the children with disabilities need to find their own neighborhood where they can flourish, too. As they get older, their world becomes smaller and smaller, unless they have access to the tools and resources to go out into the typical world. Living with us would be very restrictive for Nora. For her, this is the least restrictive environment."

"Parents should remember that even if you make critical mistakes along the way, things have a way of working themselves out, " says Paul Prior. "We never could have imagined such a spectacular program for David, in an integrated community. He takes better vacations than I do! He has a very fulfilling life."

WHAT PARENTS CAN CONTROL:

- Where resources will go.
- Preservation of eligibility for state and federal assistance programs through the creation of a special needs trust.
- Ensuring that family members are not financially or emotionally burdened, by planning ahead, making a will and establishing guardianship.
- Enhancing the individual's quality of life by providing resources for special activities, vacations, visits with siblings and other personal things.

STEROID USE in the Neonatal Intensive Care Unit:

A Preventable Cause of Cerebral Palsy and Developmental Delay

by Andrew Unger, MD

Each year some 40,000 infants in the United States are born more than ten weeks prematurely, that is, after a pregnancy of less than 30 weeks in length. Just 20 years ago, the majority of such newborns died shortly after birth, usually because their lungs were too immature to allow them to breathe effectively. Now, at least 80 percent of extremely premature infants survive to hospital discharge. Those that do perish most often succumb in the first week of life, from strokes, infections and birth defects. Death from the typical lung disease of prematurity—Hyaline Membrane Disease (HMD) or Respiratory Distress Syndrome (RDS)—has become quite rare.

The reasons behind this dramatic improvement in the outcome of preemies with HMD/RDS are important to understand, because the improvement in survival has not been associated with a reduction in the rate of brain damage among the survivors. Many extremely premature infants (perhaps 20 percent, or some 6,000 to 7,000 per year in the US) have either developmental delay (DD) or cerebral palsy (CP). Recently, we have learned that some of these disabilities may be preventable by avoiding administration of a drug, dexamethasone, once commonly used in neonatal intensive care units (NICUs). Understanding this requires an overview of the entire subject of DD and its relationship to extreme prematurity.

Extremely premature babies are not just "small" or "early." They're not ready yet. None of their organ systems function as they should. Starting at the top, almost all of the complex pattern of hills and valleys of the cerebral cortex—the thinking part of the brain—are not even visible in the brain of a 26-weeker. Should such an infant come to autopsy, her brain will look as smooth as a cue ball, split just once down the middle and once on each side. The connections that form the thinking part of the brain, connections designed to develop in the dark, warm, wet, pain-free environment of the uterus, now must develop in a bright, dry, painful NICU. The chances for abnormal development are high.

Inside the premature brain, blood vessels in the ventricles—the fluid-filled chambers where spinal fluid is made—are present that would later shrink and disappear naturally, if the pregnancy were to last until the eight month. Prior to that, these vessels, which are thin-walled and not designed to withstand large changes in blood pressure, may burst and cause strokes. Moreover, the blood supply to the brain surrounding these ventricles, the periventricular white matter, is tenuous. Damage to the periventricular area, often caused by low blood pressure or infection, can cause CP.

Premature lungs are both stiff and sticky. In particular, they lack surfactant, the natural lubricant that keeps the walls of the little air sacs where gas exchange occurs from sticking to each other at the end of expiration. If premature labor is detected early enough to allow delivery to be delayed by a few days, the expectant mother may receive two doses of a particular steroid, betamethasone, that induces the fetus to make surfactant. Often, this minimizes the severity of the subsequent HMD/RDS. Of note is that this particular steroid is given briefly to the mother, not to the fetus directly, and rarely more than once.

Surfactant is available as a medicine to be given directly into the newborn's lungs, and better ventilators have been developed that allow gas exchange to occur in the face of severe disease. The problem of premature lungs sticking to themselves internally has basically been solved, so most extremely premature infants now survive their initial lung disease.

After the HMD/RDS has resolved, however, these immature lungs still contain far more connective tissue than adult lungs. They are stiffer—like sponges instead of balloons. Extremely premature infants will often require continued respiratory support (a ventilator or continuous positive airway pressure) for one to six weeks after their initial lung disease has resolved, until the Chronic Lung Disease (CLD)—a developmental phase in which the connective tissue "clears out" and the air sacs grow—improves. During this phase, optimizing nutrition and avoiding hospital-acquired infections facilitates more rapid lung growth.

Let us turn our attention to the premature infant's gut, and the problems of nourishing such a tiny baby. Until approximately 32 weeks gestation, the gut does not move food forward from mouth to anus with any degree of regularity. Not only do premature babies not know how to swallow, but their stomachs don't empty well, their small bowels don't digest well and their colons don't excrete well. Food just seems to slosh around. At a time when human brain growth is supposed to be at its most rapid, the period from 24 to 30 weeks gestation, the fuel for that growth is difficult to process postnatally.

While it is beyond the scope of this article to describe particular methods of encouraging adequate nutrition in the NICU, some generalities may be stated. Early initiation of small volume feedings coupled with aggressive intravenous nutritional support in the first week or two of life, followed by rapid advances in feed volume once the gut "wakes up," seems ideal. Such an approach has its risks—a life-threatening bowel infection called necrotizing enterocolitis may occasionally occur—but these risks are outweighed by the benefits, and can be minimized particularly by feeding the baby his own mother's milk. Necrotizing enterocolitis is much less common in breast-fed newborns. In addition, a rapid transition away from IV nutrition minimizes the risk of blood infection from the intravenous lines themselves.

"School" brings special challenges for a child with special needs

With over 40 years of assisting the child with special needs and his/her family we can offer:

- **Preschool Programs for the Child, age 3 to 5 with:**
  Mild to Profound Developmental Delays, Sensory and Communication Delays, and Hearing Impairments
- **School Program for the Child, age 3 to 21 with:**
  Multiple Developmental and/or Medical Needs including Acquired Brain Injury
- **We Offer All Students:**
  Small Classes with 210-day Caldenar
  On-site Nursing Services
  Assistive Technology
  Customized Adapted Equipment
  Augmentative Communication
- **We Offer All Families:** *(enrollment in school not necessary)*
  Comprehensive Audiological Services
  Family Support Resources (toy library, parent networking & referral, and more)

continued from page 81

To summarize: premature infants are at risk of brain damage because of environmental stress, strokes, particularly vulnerable brain tissues, malnutrition and infection. Until the NICU can more closely resemble a uterus (and efforts to reduce environmental stress are underway), or until premature birth itself can be prevented, some premature infants will inevitably be at risk for serious developmental delay. Doctors have just learned, however, that one of the medicines in common use in NICUs increases that risk markedly.

Let us return to chronic lung disease, CLD, the state of the premature lung after the initial HMD/RDS has been treated with surfactant. Lungs with CLD are stiff; the preemie with CLD may be too weak to move enough air to survive. We know this stiffness will lessen over the course of weeks of patient attention to nutrition and avoidance of infection. In the meantime, though, the infant must be attached to a breathing machine—an uncomfortable life for both the baby and her parents. In addition, correct respiratory support is labor-intensive, expensive, and risky in its own right, predisposing to pneumonia and trauma to the airway. All these risks, too, can be minimized, but only if there are enough experienced nurses to allow for constant and careful observation of every infant.

In the early 1990s a serious nursing shortage developed in the United States. At the same time, hospital reimbursement for the care of premature infants declined, as HMOs and other third-party payers pressured physicians to shorten lengths of stay. If the duration of chronic lung disease could be shortened, money could be saved and, perhaps, outcomes improved. A drug to treat CLD was needed.

An old medical aphorism states that "in times of desperation atheists turn to God, and doctors turn to steroids." Pediatricians already knew that, given prenatally, steroids could help prevent HMD/RDS. Why, then, not try steroids after birth to treat chronic lung disease? In fact, there was every reason to think that dexamethasone—a powerful synthetic steroid that reliably loosens up connective tissues—might improve CLD. That dexamethasone treatment also causes high blood pressure and ulcers and predisposes to fungal infection may be true, but we have other drugs to treat those complications. That dexamethasone also stunts growth—well, that is the tradeoff for keeping the premature infant alive. So dexamethasone was tried, and it worked. A few days of steroids and many ventilator-dependent infants can come off their machines. Their parents can hold them more easily, their sore mouths and noses heal, they can learn to eat earlier, and then, perhaps, even go home sooner. Parents are happier. Money is saved.

The problem is that premature infants treated with steroids are approximately twice as likely to have DD or CP as those not treated. No drug can treat that period of stunted growth the steroids cause. Developmental delay in the premature infant is usually the result of many cumulative insults. Harsh environment, inadequate nutrition, and infection all may contribute. Steroid treatment of CLD seems, often, to be the final straw.

The data are new, and still somewhat controversial, but most neonatologists, the American Academy of Pediatrics and the Canadian Pædiatric

Society now accept them. From the February 2002 issue of *Pediatrics:*

"On the basis of limited short-term benefits, the absence of long-term benefits, and the number of serious short and long-term complications, the routine use of systemic dexamethasone for the prevention or treatment of CLD in extremely premature infants is not recommended. ... Outside the context of a randomized, controlled trial, the use of corticosteroids should be limited to exceptional clinical circumstances (eg, an infant on maximal ventilatory and oxygen support). In those circumstances, parents should be fully informed about the known short- and long-term risks and agree to treatment."

An old medical aphorism states that "in times of desperation atheists turn to God, and doctors turn to steroids."

In short, while dexamethasone does help get preemies "off the ventilator," that small benefit is not worth the long-term risk.

So how was is it that perhaps one-third of extremely premature infants born in the US in the 1990s were treated with a drug that we now learn may cause DD and CP? The answer is simple: only large, long-term studies, many just completed, could reveal the added risk. Individual neonatologists rarely

> **As is often the case, a promising treatment only later has been shown to have serious, unanticipated side effects.**

continued from page 83

treat NICU graduates beyond a few months after discharge. Low IQ and cerebral and motor delay are generally diagnosed after the baby is one year of age. As is often the case, a promising treatment only later has been shown to have serious, unanticipated side effects.

What, then, can we learn from the data regarding post-natal steroid use in the premature infant? As of 2002, we know that such treatment should be restricted to those rare, life-threatening cases of CLD that may, on occasion, occur in the tiniest and sickest of preemies. More important, however, parents and professionals alike must learn to accept better the dual nature of modern neonatal care.

For the first few days of life, most extremely premature infants are critically ill—so sick they may die. Almost any intervention is justified in order to keep the baby alive. After the crisis has passed, however, aggressive interventions are more likely to harm than help. The rest of a tiny preemie's hospitalization must be focused on growth, establishing good nutrition and avoiding infections. The change in emphasis—for parents, for doctors, for nurses—is both necessary and profound. Patience, not action, becomes a virtue. Less truly becomes more.

Regardless of how they are cared for, many infants born after pregnancies of less than 30 weeks will have handicaps and some, tragically, will die. We can minimize the suffering of the survivors only by remembering what our grandmothers knew:

Babies need to be kept warm and clean. They need to be held and well fed. And once a baby is growing, only rarely does it need strong medicine. EP

NEVER GIVE UP THE SEARCH TO FIND THE RIGHT PLACE...

"I was advised to settle for something less, but kept searching. When I visited Crotched Mountain there was a tangible difference in attitude– a professionalism, respect, and "can-do" attitude that set them apart. Standards are high and the approach genuine–they really care! I am very happy with Crotched Mountain and most importantly, so is my son Jared. He has grown enormously in many ways and is becoming the young man that I always thought he could become. It's a family's dream, come true!" —*Kathy Berns*

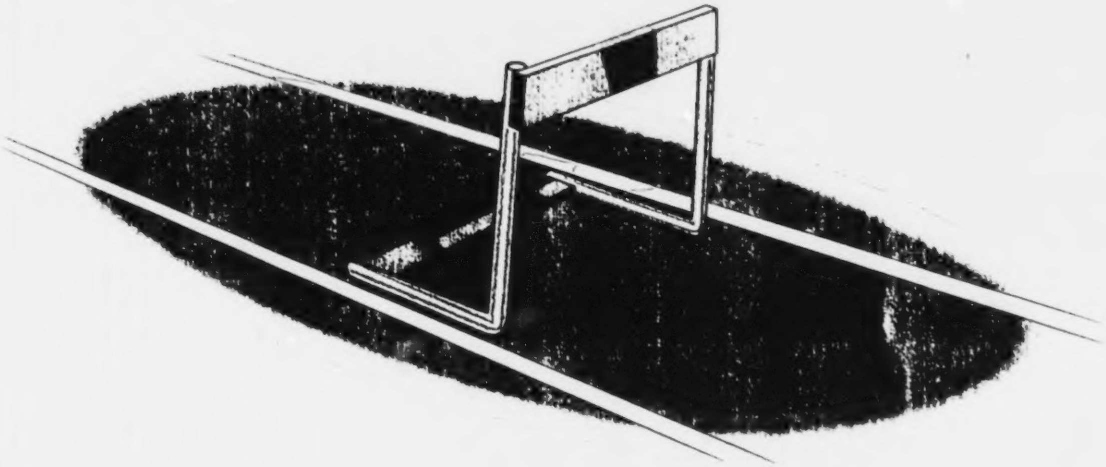
Coordinating your child's care shouldn't be another hurdle.



Neurological evaluations. Educational consultations. Behavioral therapy. We understand how frustrating and confusing meeting your child's special needs can be. That's the idea behind Bancroft NeuroHealth's **Center for Children and Families**. The Center's team of medical and clinical professionals offers a variety of cutting-edge interdisciplinary evaluation, treatment and planning services for children with complex medical, behavioral and special education needs — **all under one roof**.

Services include medical consultation; neurology clinics; developmental pediatrics; rehabilitation services such as occupational therapy, and speech and language therapy; early intervention programs; chronic disease services; behavioral health school consultation; home-based services; and family support and education.

You face enough hurdles in your life: getting the best care for your child shouldn't be one of them.

Sharing the Caring

Sally, 40 lbs. and 45" tall, in the #8600 Reclining Bath Chair with #8875 Head Pad

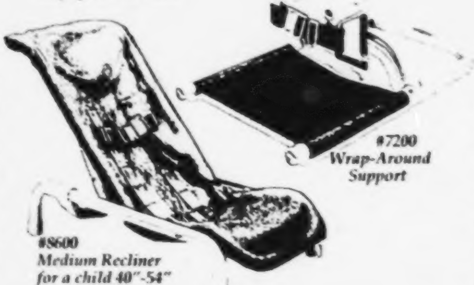
Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

■ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

#5800 Hi-Back Positioning Commode for junior adults

■ At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child – and you – to enjoy the bath.



#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

■ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.

#2000 Car Seat

Why do these products work so well?

Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child,** with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

SHALEIGH

Shaleigh is two-and-a-half years old and a happy, loving, identical twin. She was born with hydrocephalus, caused by an intraventricular hemorrhage, which now requires her to have a VP shunt. Shaleigh also has cerebral palsy and is legally blind. Her speech is limited to "Hi!" She warms anyone up with her darling little smile. She loves *Barney*, music, her Raggedy Ann doll and spending time with her Mom, Ronda, older brother Shane and twin Sage.

PAYTON

Payton Perkins is two years old and was born five-and-a-half weeks early. He has had ten surgeries along with a number of small procedures. Payton went through physical, speech and feeding therapy and uses a G-tube. He is a very smart, loving and funny boy who has won several contests despite his health. He is his mother Wendy's "miracle child," and his dream is to one day go to Walt Disney World.

New York Yankee Manager, Joe Torre with TSA member Joriel Sharp.

The National Tourette Syndrome Association

By Judit Ungar and Fred Cook

A truly grassroots organization, the Tourette Syndrome Association (TSA) was founded in 1972 by a small group of people from affected families sitting around a kitchen table in Queens, NY. Today, with a network of 45 state chapters and hundreds of local support groups across the US, the organization hews to its three-pronged mission of *individual and family service, professional and public education and research.* Along with a 25-member volunteer board, world-class medical and scientific advisors help distinguish TSA as the only national, voluntary non-profit membership organization dedicated to identifying the cause, finding the cure and controlling the effects of Tourette syndrome (TS).

Named for the French neurologist Georges Gilles de la Tourette, who first described the disorder in 1885, TS is an inherited neurobiological disorder marked by involuntary twitching and vocal tics that affects more than 200,000 Americans. Many more people are believed to manifest associated behaviors such as attention deficit hyperactivity disorder (ADHD) and obsessive-compulsive disorder (OCD). As a spectrum disorder, TS varies in severity from very mild to quite severe. However, most cases can be categorized as mild.

A diagnosis of TS can be made by observing symptoms and the history of their onset. There is no blood analysis or neurological testing available to diagnose TS. Key symptoms include multiple motor and vocal tics, the occurrence of tics many times a day for more than one year, a waxing and waning of tic severity and onset before age 18. Genetically, males are three to four times more likely to have TS than females.

When necessary, moderate to severe tics can be controlled with medications such as Haldol, Catapres and Orap. Contrary to years of sensationalized media accounts, coprolalia, or the involuntary uttering of obscenities or inappropriate language, is one of the rarest symptoms of TS and is present in fewer than 15 percent of all people with the disorder.

While the exact cause of TS remains unknown, considerable evidence points to the abnormal metabolism of brain chemicals called neurotransmitters. Although there is currently no cure, the lifelong disorder, which affects all races and ethnic groups, is not life-threatening or degenerative and does not affect intelligence or life span. TS symptoms have also been shown to decrease in adulthood.

Each day, the TSA responds with compassion and support to hundreds of phone, e-mail and written inquiries from people across the nation and around the world who seek answers about Tourette syndrome. While providing general information about the disorder, the association also assists people with research on significant issues and new treatments, locates advocacy groups, special schools and camps and distributes comprehensive lists of TS physicians, allied and clinical professionals and legal advocates.

TSA also distributes an informative quarterly newsletter to more than 40,000 people that contains the latest information on treatment, research programs and scientific discoveries; publications for children and their families, including a new children's newsletter; and an annual medical letter sent to medical and scientific professionals. Moreover, TSA's extensive catalog of hundreds of publications and dozens of videos helps serve the needs of persons with TS, their communities and the professionals who care for them. Many of the organization's publications and videos offer valuable medical advice and guidance and, as well, seek to reinforce a recurrent TSA theme: that most people with the disorder can lead productive lives and, in many cases, attain high levels of achievement.

Although the public's awareness of TS and its symptoms has steadily increased over the years since the organization's founding, reducing stigma and promoting further public awareness and understanding remains a primary objective. To this end, the association continues to place radio/print/television public service announcements in media outlets across the nation while maintaining a toll-free hotline and a newly revamped website (see information on page 93). Last year, TS was a featured topic on "the Oprah Winfrey Show" and the subject of countless national newspaper, magazine, radio and television stories.

Fostering acceptance and tolerance for people with TS is part and parcel of TSA's educational mission. The association accomplishes this through national,

continued from page 91

regional and local conferences and the development and dissemination of educational programs for both the professional and lay communities.

Local TSA chapters support the work of the organization by creating 24-hour information phone lines, organizing and coordinating educational and medical conferences and teaching educators about TS and how best to work with students with the disorder. Together, chapters and support groups provide socialization opportunities for adults, families and children affected by TS in an environment of complete acceptance and tolerance.

An excellent example of just such an environment is TSA's biennial National Conference, to be held in Alexandria, VA from October 31 through November 3, 2002. The Conference brings together members of the TS community and their families, educators, TS advocates, physicians, researchers, allied professionals and TSA staff members to interact, socialize, share ideas, discuss issues of concern, learn from experts and, in many instances, meet face-to-face for the first time.

TSA's government relations efforts seek to educate lawmakers, federal agencies and the public about the impact of legislation, regulatory actions and public policy on the health and well-being of people with TS. Two recent government relations successes were the inclusion of TS in the Children's Health Act of 2000 as a disorder to be supported by the federal government, and TSA's naming in the Senate Appropriations Bill of 2001 for possible funding of its healthcare professionals training program. Recent efforts have also focused on garnering support for renewal of the Individuals with Disabilities Education Act and for Mental Health Parity legislation.

TSA's development and special events efforts both raise needed funds to support the vital work of the association and assist in raising the association's profile. TSA coordinates major dinner functions on the east and west coasts, concerts, golf outings, and sweepstakes. TSA also provides technical support to chapters that are in need of assistance in their own fund-raising initiatives.

TSA has been involved in virtually all of the major research conducted on TS. Since 1984, TSA has directly funded research in a variety of TS-related fields, from behavioral neuroscience and neuroimaging to epidemiology and pharmacology. TSA established the Brain Bank

Specially trained dentists and custom facilities are desperately needed in New Jersey to treat individuals with physical disabilities, such as cerebral palsy, muscular dystrophy, spina bifida, and Lesch-Nyhan disease.

The Delta Dental Plan of New Jersey Foundation is partnering with Matheny School and Hospital to create a new, state-of-the-art dental facility to improve access to dental care. This initiative is part of Delta Dental's mission to promote and assist educational projects devoted to the enhancement of dental health and research programs designed to increase public awareness of the general benefits of good health, and to improve dental health through the science of dentistry. For more information about the Matheny School and Hospital dental facility, call (908) 234-0011, ext. 231.

Program in 1985 to help facilitate the donation, storage, and distribution of rare brain tissue samples to encourage the brain chemistry investigation that is so important to TS research.

In 1999, TSA's International Genetics Consortium heralded a major breakthrough in TS research when it announced the discovery of two small pieces of the human genome that may be strongly implicated in causing TS, and four additional regions that may contribute to it. The discovery was hailed by the scientific community as a major breakthrough that can help point TS researchers in the right direction to locate the TS gene.

In 2000, the National Institute of Health helped to buoy TS research when it awarded an unprecedented, multi-million-dollar five-year grant to TSA. The grant, usually reserved for research centers associated with universities, was the first of its kind to be given to a family-oriented, voluntary health organization.

As the only national voluntary group devoted solely to serving the Tourette syndrome community, the Tourette Syndrome Association looks ahead to a future filled with promise and a deepened resolve to fulfill its original mission: individual and family service, professional and public education and relentless TS research. With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler***.

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Please visit our Worldwide Web site at www.redbarn-enter.com for additional details and a video demonstration of the ***Creepster Crawler***.

Keeping kids safe on the Internet

by Sheryl Burgstahler, PhD

When you think of the wide range of potential dangers on the internet, it's easy to feel helpless and consider prohibiting its use entirely. Unfortunately, there is no foolproof way to protect our children from all of the dangers they may encounter, on the internet or anywhere else.

For my 12-year-old son, the internet is just one more place to find interesting things to do—chat with his cousin in Minnesota, check out the baseball cards available on EBay, look for a new swimsuit at Old Navy or cruise for new computer games. It all seems innocent enough. But, like many parents, I worry about who my son might meet on the net and what inappropriate materials he might encounter on his journeys through cyberspace. Although the vast majority of internet resources and communications are not harmful to children, and reports of child abuse that involve the use of the internet are rare, our kids might stumble into situations or actively participate in communications of which we would not approve. On the net, they might:

- Become exposed to materials that include content that is sexual, violent, hateful or otherwise inappropriate for children.
- Be exposed to communications that are harassing or demeaning and, perhaps, even be drawn into these types of conversations themselves.
- Be encouraged to participate in activities that promote prejudice, are unsafe or are illegal.
- Meet a child predator who uses the internet to develop trusting relationships with kids and then arranges to meet them in person.
- Make purchases using your credit card number.Keep in mind that children can unintentionally encounter objectionable material, so be sure not to blame them if they do. Such materials can be found by innocently searching for information with a search engine, mis-typing a web address, or stumbling into an adult-oriented chat room or bulletin board. For example, children may encounter web sites designed for adults that have articles, pictures and videotapes of a sexually explicit nature; site owners may make little or no attempt to restrict access to adults.

Teenagers are particularly vulnerable to being exposed to material and engaging in activities that are inappropriate. This is because they are more likely than younger children to use computers unsupervised, have the skills and interests to do searches, participate in discussions through email, chat, or bulletin board systems where inappropriate communications can occur, and have access to credit card information.

Clues that your children might be engaging in inappropriate activities include excessive use of the internet, particularly when you are not home or when you are sleeping. Another clue is if they seem uncomfortable when you ask about activities they are engaging in on the net or when you walk near their computer screen. Withdrawal from family and friends and lack of interest in activities that they once enjoyed are also signs that children might be involved in things that are unhealthy.

However, if you would like your children to have access to the wide array of opportunities the web offers, consider taking some simple safety precautions that will also help your children learn to take responsibility for their actions. In this Tech Talk column, I'll give you some basic guidelines, an example of safety rules you might want to have your children adopt, and resources for further exploration of this topic. Let's start with some simple steps you can take to help keep your kids safe when they're out on the information superhighway.

PLACE YOUR INTERNET-CONNECTED COMPUTER IN A HIGH-TRAFFIC AREA

If the internet-connected computer is in the family room or other busy area, children will be less likely to engage in inappropriate activities. Avoid having a computer with an internet connection in a child's bedroom; this might be a better place for a computer with educational software, applications software, and games, but no internet connection.

COMMUNICATE

Talk to your children about both the benefits and dangers of the internet. Describe scenarios in which a child could be exposed to inappropriate resources or communications. These conversations should be periodic and along the same lines as those about where it is safe for them to ride their bicycles and what to do if a friend wants to play with his dad's gun. Be clear about what activities your children are allowed to engage in, what types of internet resources are not appropriate for them, and what they are to do if they encounter materials that they feel uncomfortable with or that they know would not be acceptable to you. Consider allowing young children to use only web sites that you have previewed. Talk about what they should do if a friend exposes them to internet use they know is wrong. Be sure your children know never to arrange a face-to-face meeting with someone they "meet" on the internet without your permission. If you approve of a meeting between your child and a person met on the internet, make sure that the meeting is in a public place and that you accompany your child.

Agree on how much time they can spend on the net and during what times of the day. Teach them about "netiquette" – how to communicate in a polite manner, avoiding personal attacks and inappropriate language and topics. Tell them not to give out identifying information such as their last name, home address, phone number or school name in a chat room, on an email discussion list, or in a message to an individual that you and your children do not both know and trust. Tell your children to never respond to messages that are harassing, threatening, of a sexual nature, obscene or that just make them feel uncomfortable.

SHOW GENUINE INTEREST, PARTICIPATE

Keep communication open. Regularly observe and ask your children what activities they are participating in on the net. Show interest in what they are doing. Have your children get online with you, then do things together. Ask them to show you what they like to do. Join your children when they are in chat areas and other communication forums. Search for resources together. You may be surprised at how much fun the two of you can have.

TALK ABOUT NEGATIVE EXPERIENCES ON THE NET

Tell your kids about times when you have received unwanted email or encountered objectionable material on the internet and about how you handled the incidents. Encourage your children to tell you if they find themselves in these situations, too. If they do, use the opportunity to remind them that not all people on the internet (or anywhere else) share the values of your family, then talk about how your children might avoid such incidents in the future, and why it is important that they not inadvertently engage in conversations by responding to an inappropriate message. Consider sending an email with a copy of the inappropriate message to your Internet Service Provider (ISP) and to the National Center for Missing and Exploited Children's Cyber Tipline at www.missingkids.com/cybertip. If you respond calmly, objectively, and take this proactive step, your children are more likely to confide in you the next time they have a problem and will learn how to handle similar situations in the future.

CONSIDER USING TECHNOLOGICAL TOOLS TO CONTROL ACCESS

Some ISPs and other online services allow parents to limit their children's access to certain types of resources, such as web sites, chat rooms, and bulletin boards that contain sexual content, violence, or prejudice; that promote the use of drugs or alcohol; that suggest activities that are dangerous or illegal; or that contain other materials considered inappropriate for children. Some services even have special areas that are just for kids. Your internet browser—the program you use to navigate—may also include features that can help you limit your children's access to web sites that are rated inappropriate for children. Separate software programs can also be purchased to facilitate safe surfing. Most of these programs can be configured by parents to filter out specific types of web sites. You can find a list of filtering programs and other resources for parents at the Tools for Families Web pages at www.getnetwise.org/tools/. None of these tools are fail-proof and your children may be able to work around them. They do not eliminate the need for consistent adult supervision.

REVIEW YOUR BROWSER HISTORY

Most internet browsers automatically save a list of the web pages recently viewed. From time to time, consider checking this history list to learn what sites your children have been visiting.

REVIEW YOUR CREDIT CARD BILLS

Check for charges that your children might have made while on the net.

DO NOT POST PHOTOGRAPHS AND NAMES OF YOUR CHILDREN ON FAMILY WEB SITES

It's tempting to brag about your kids by posting their pictures and names on your personal or family web site, but revealing personal information like this can compromise the safety of your children.

CONSIDER HAVING YOUR CHILDREN USE FICTITIOUS NAMES WHEN THEY COMMUNICATE IN PUBLIC FORUMS ON THE NET

Your children can get free web-based email addresses that do not include their names or suggest their genders. These email addresses could be used when they communicate in chat rooms or on discussion lists or bulletin boards. Also consider having them share an email address with you, especially if they are young children.

Tell your children that "friends" online may not be who they seem. It is

easy for people to misrepresent their gender, age, and other personal information. That "14-year-old cheerleader" they are corresponding with might in reality be a 65-year-old pedophile. Regularly remind them that some things posted online are not true. They should be particularly suspicious about offers for products that seem "too good to be true"—they probably are.

ESTABLISH FAMILY RULES FOR INTERNET USE

The specific rules you establish should depend upon the ages of your children, the level of control you wish to exert, and your family values. Consider adopting a set of rules similar to My Rules for Online Safety, published by the National Center for Missing and Exploited Children (www.safekids.com/child_safety.htm). Tailor them with your children and post them near the internet-connected computer in your home. For example:

- I will not give out personal information such as my address, telephone number, parents' work address and telephone number or the name and location of my school without my parents' permission.
- I will tell my parents right away if I come across any information that makes me feel uncomfortable.
- I will never agree to get together with someone I "meet" online without first checking with my parents. If my parents agree to the meeting, I will be sure that it is in a public place and bring my mother or father along.
- I will never send a person my picture or anything else without first checking with my parents.
- I will not respond to any messages that are mean or in any way make me feel uncomfortable. It is not my fault if I get a message like that. If I do, I will tell my parents right away so that they can contact the online service.
- I will talk with my parents so that we can set up rules for going online. We will decide upon the time of day and length of time I can be online and appropriate areas for me to visit. I will not access other areas or break these rules without their permission.

KEEP PERSPECTIVE

Taking steps to keep our children safe from individuals who do not have their best interests in mind provides an opportunity to share with our children facts about the real world and to reinforce the values we hold dear in our own families. **EP**

TWICE-EXCEPTIONAL:

Learning Disabled and Gifted

It's September and our children are heading back to school (whew!). I thought it appropriate in this back-to-school issue of EP to reflect on research that addresses a narrow but fascinating topic: children who are twice-exceptional, meaning that they have abilities in the gifted range as well as some significant learning challenges, and what parents and educators can do to help them.

Most school children can identify at least one famous person who had, or has, a disability (or two) but went on to achieve great things (e.g. Helen Keller, Stephen Hawking, Ludwig van Beethoven and Stevie Wonder). If you read EP's July, 2002 Research Reflections you know that Jim Eisenreich went on to play major league baseball despite his Tourette syndrome. Yet the combination of a learning disability and giftedness is not something we expect to find, and so it is often missed.

Many of us are old enough to remember learning the three R's: Reading, Writing and 'Rithmetic. Today's children often don't recognize the names of these skills, as they are now called "language arts," "writer's workshop," "core skills," "math" or, worse yet, "new math." Despite these new titles, about 7 percent of children are reported to have a disability, known as a "specific learning disability," in one of the three R's. This qualifies both the children and their parents for the title exceptional.

Children with remarkable abilities in these and other areas are also called "gifted," and denoted professionally as exceptional. Oddly enough, federal legislation that provides funding to children with exceptionalities does not include children with special talents or gifts, yet these children—and their parents—are also exceptional.

I was I think in 5th or 6th grade when I was given an IQ test, and they found my IQ as eligible for the gifted and talented program. Then they gave me a test they used for placement in the program. They told me I didn't make it but not to feel bad, because learning disabled [persons] usually score about 15 percent lower than normal people, so I probably would have made it if I had not been learning disabled. [From: Reis, Neu, & McGuire, 1997, p. 468]

Who is learning disabled and/or gifted?

The U.S. Department of Education reported that in 1994 more than four percent of school children in the U.S. (approximately two million children) received services for learning disabilities over one school year (http://www.kidsource.com).

The National Association for Gifted Children (NAGC) currently reports that five percent of the student population in the U.S. (approximately three million children) are gifted (http://www.nagc.org).

What is a learning disability?

According to the 1997 IDEA Regulations: "Specific learning disability is defined as…a disorder in one or more of the basic psychological processes involved in understanding or using language, spoken or written, that may manifest itself in an imperfect ability to listen, think, speak, read, write, spell or do mathematical calculations, including conditions such as perceptual disabilities, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia." Of course there are additional criteria and alternative definitions, but these are beyond our scope here.

What is giftedness?

NAGC defines a gifted person as "someone who shows, or has the potential for showing, an exceptional level of performance in one or more areas of expression. The term giftedness provides a general reference to this spectrum of abilities without being specific or dependent on a single measure or index."

M. Elizabeth Nielsen and her colleagues are researchers focusing on children who are twice-exceptional. Their Twice-

Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, where she has been a researcher for 20 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of mental retardation, dual diagnosis and the transition to adulthood. Dr. Blacher has developed **Research Reflections** as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to **Research Reflections** and any suggestions you might have. Send e-mail to: jan.blacher@ucr.edu.

Exceptional Child Projects take place in the southwestern United States (Neilsen, 2002). Through their outreach and advocacy they have found that 3.5 percent of children with LD could also be identified as gifted.

Identifying children who are twice-exceptional

It is likely that either type of exceptionality (learning disabled or gifted) could mask the identification of the other. "These students have disabilities that conceal their gifts, and gifts that camouflage their disabilities" (McCoach et al., 2001, p. 405). Often special educators, along with teachers in general education, are quick to highlight deficits and concerns while overlooking unusual talents and assets. There is much professional support for the idea that all children— not just those who are "typical"— should be screened for giftedness (special gifts and talents).

D. Betsy McCoach and her colleagues at the University of Connecticut are working on developing "best practices" for the identification of gifted students with learning disabilities. They argue that learning disabilities can exist in children at all ability levels. Yet most school psychologists and practitioners would agree that screening all school children for hidden learning disabilities is not feasible. Thus, learning disabilities are not usually identified until the child begins to underachieve, and this unfortunately, may be too late. G. Reid Lyon, Chief of the Child Development and Behavior Branch of the National Institute of Child Health and Human Development at the NIH has noted that approximately 74 percent of students identified as LD after age nine continue to have reading difficulties during their school years. One goal for researchers then, is to more clearly identify characteristics of children, at any age and ability level, who have a learning disability.

In children with superior intelligence, identification of learning disabilities may come even later, if at all. Their giftedness can mask a bona fide learning disability. For example, if the disability is in reading, the child might be able to keep

Anderson School

Building A Tradition of Service for Over 78 Years

Anderson School provides the highest quality programs possible for children (ages 5-21) and adults with autism and other developmental disabilities. Anderson School is an educational residential community committed to an ongoing and fully integrated support network for their families and guardians. As an organization, Anderson School constantly strives to provide an enriched and positive climate filled with educational, cultural and recreational activities designed to foster continuous growth, independence and social interaction.

Located near historic Hyde Park (approximately 95 miles from midtown Manhattan) on a scenic 100 acre wooded estate overlooking the Hudson River, Anderson School serves all of New York State and welcomes out of state applications.

continued from page 101

up well in the early grades because of superior compensatory abilities (e.g. outstanding verbal, reasoning or problem-solving skills). In the later grades, reading content becomes more difficult and abstract, and the child who is gifted may falter, earning average or even below-average grades.

A 2002 article in Exceptionality provides data related to this point. M. Elizabeth Nielsen reports child subtest scores on an intelligence test (WISC-R) and an achievement test (Woodcock Johnson Cognitive Abilities Test Battery-Revised) for three groups of children: those with LD only, those with giftedness only and those with both types of exceptionality. The gifted/LD children had a high IQ profile strongly resembling the gifted group and a low academic achievement profile, like the LD group. One worry is that teachers and parents may misidentify a lower-achieving gifted child as "unmotivated" or "inattentive" or "mismatched with the school," and miss the very real learning difficulties.

Case: Juan

Contributed by Dr. Sally M. Reis, University of Connecticut

Juan, a college student majoring in physics, experienced many difficulties in both his academic and personal life. Juan was labeled twice-exceptional, as he had experienced many problems in school due to his remarkably high abilities in one area paired with a learning disability in another area. Though his verbal IQ is over 140, he experienced problems in school at a very early age and was identified as having a learning disability in third grade. His learning disability involved both dyslexia and information processing disorders, which caused him to experience multiple learning problems in early elementary education.

Juan was subsequently placed in a full-time, self-contained special education classroom for students with disabilities in grades three through six. Other students in this class had been identified as having severe developmental disabilities, emotional or behavioral disorders or specific learning disabilities. During his years in this class, Juan became severely depressed and recalled, "This time in my life was degrading. I was very resentful of it. I don't really remember that part of my life that well. I've blocked it out. I knew I was different from the other kids."

Juan was retained in fifth grade while in the self-contained special education class, and remembers that he became a disciplinary problem at that time. He has terrible memories of his experiences. He explains, "They used to send us out to recess with the mainstream kids. I remember being sort of alone and being made fun of. They called me retarded."

Juan's parents explained that they had put their faith in the school personnel who had identified the learning disability and recommended this special education approach. When his parents understood the ramifications of these difficult school experiences, they sought professional counseling for Juan and placed him in a private school with small classes that provided a great deal of individual attention. Juan began to learn how to compensate for his learning problems and gained enough reading proficiency to read independently. However, spelling, reading and writing still remain problematic for him.

Other negative experiences influenced Juan's education. Despite his high aptitude, he was never provided any opportunity to develop his talents. Almost all of the time he spent in school was related to improving his reading and writing skills. Yet, these are still weak because of his learning disabilities. With the right types of support and the acquisition of compensation strategies needed to directly address his learning disability, he became successful.

Although currently involved in a university learning disabilities program, it is questionable whether Juan will finish college, as he continues to face academic challenges due to his learning problems. Juan carries a great deal of anger about what happened to him in school, particularly his elementary school years. He believes these experiences impeded his educational performance both at that time and later in his educational life. He continues in therapy and has the full support of his parents.

The risks of overlooking either exceptionality

Sharon Dole, in an article that appeared in the Roeper Review in 2000, has noted the heightened risk placed on children with LDs who are gifted. She lists the following social-emotional characteristics of such children that increase their vulnerability: poor self-concept, poor self-efficacy, hypersensitivity, emotional ability and high levels of frustration, anxiety and self-criticism. Researchers Susan Baum and Steven Owen studied three groups of 4th to 6th graders: students who were of high ability, average ability and high ability/learning disabled. The single largest factor that distinguished the high ability/LD group from the other two groups was a sense of inefficacy in school. While these high ability/LD children had tremendous creative potential, they also had disruptive behaviors and low levels of academic success. These two qualities place them at academic and behavioral risk and on a potential trajectory that could lead to school failure. This is a big price to pay for an overlooked learning disability.

What is a protective factor?

Resiliency is a popular theme these days. It refers to protective factors that buffer an individual's response to stressful life events. Psychologist Norman Garmezy has noted three categories of protective factors, all of which are relevant to gifted/LD children: personality factors (e.g. self-esteem, coping strategies), family cohesion and lack of disharmony and external support systems.

While gifted children with LD may be at risk because of their unusual combination

BEST COPY AVAILABLE

of gifts and disability, there is some disagreement as to whether giftedness increases the vulnerability of these children or strengthens their resiliency. One study described seven gifted children. All had unusual "cognitive appraisal" coping strategies, which required abstract thinking and intelligence, two indicators of resilience. In dealing with stressful situations, these children used problem-focused strategies (changing one's behavior to adjust to the environment) and emotion-focused strategies (changing one's interpretation of a situation). Other studies of protective factors have found benefits from early identification of a learning disability, intensive intervention during school years, ongoing support and counseling. The #1 protective factor in the lives of children who are twice-exceptional is ongoing parental understanding and support. Lest you think you have to leap tall buildings in a single bound, read on.

What can twice-exceptional parents do?

- Be involved in your child's school program.
- Identify attributes of giftedness.
- Identify behavior disruptions, learning struggles, or poor academic success in the face of high ability.
- Be aware of a mismatch between your child and his or her school placement.
- Provide emotional support and professional counseling as needed.
- Provide opportunities for involvement in extracurricular activities that will help develop self-esteem.
- Learn about the options available to address your child's giftedness as well as his or her learning disability.

Children who are twice-exceptional will have ongoing needs, demands and pressures as they move through important life transitions. It's easy for exceptional parents to get bogged down in working out the details of an IEP at each age and stage. But parents and teachers also need to be mindful of the exceptional skills the child brings to the table, and work twice as hard at developing those. **EP**

LEGISLATIVE UPDATE

Washington Politicos Focus on IDEA Reauthorization

Special education is one of Washington's hottest topics right now, as the Individuals with Disabilities Education Act (IDEA) is up for reauthorization this year. This will affect the education of every child with disabilities in the United States.

The U.S. House of Representatives has been examining special education issues through the Subcommittee on Education Reform. In addition, President Bush formed a Commission on Excellence in Special Education to study special education issues at the federal, state and local levels and submit a report on their findings. The following are some issues receiving a lot of attention.

Full federal funding: This year, only 17 percent of the total cost of IDEA implementation was covered by the federal government. When IDEA was originally enacted, Congress pledged to pay 40 percent; this means that a significant increase in funding is needed to reach the level of federal support originally pledged.

President Bush's FY2003 budget calls for a $1 billion increase to IDEA, Part B funding, providing a total of $8.5 billion in grants to states. The budget resolution passed by the House of Representatives this spring includes the increase for next year as well as a 12 percent increase every year after that for the next nine years. The Senate is expected to act this fall. The goal is to reach full federal funding within a decade.

Early intervention: Many feel that the focus of IDEA should shift from simply accommodating those with diagnosed disabilities to preventing and intervening. As the Commission's report put it, "The model guiding education focuses on waiting for a

PATHFINDER VILLAGE
Specializing in Down Syndrome

Pathfinder Village is a warm, friendly community in the rolling hills of Central New York. Here children and adults who have Down syndrome realize success as they work in the community, go to school, and take part in recreation & social programs.

Pathfinder Village offers:
- 10 nurturing family homes
- a dedicated & caring staff
- year-long school with teen vocational program
- on-site nursing staff
- outreach services at the Kennedy • Willis Center on Down Syndrome
- a history in human services dating to 1922

As our residents grow in independence, they build lasting friendships, become partners in the world, and take in all that life has to offer.

child to fail, not on early intervention to prevent failure." That is, instead of waiting for problems to present themselves, more effort should be made to provide help to children early on, when preventive measures may still give them a chance to catch up to their peers.

Overidentification of minority students: Studies have shown that disproportionate numbers of minority students are identified as having disabilities. While there is a documented link between poverty and disability, this factor alone cannot begin to account for the overrepresentation of minorities in special education. IDEA '97 requires states to gather racial data and to monitor identification levels, but the problem still exists and needs to be corrected.

Too much paperwork: President Bush has said that he wishes to reduce the amount of paperwork involved in special education, and to start focusing more on results than on procedures. While documentation is important and serves many useful purposes, many parents can attest to the fact that some of the paperwork currently required seems unnecessary or even irrelevant. What really matters is whether or not children are learning and succeeding in school; the methods used to help them do this are only of secondary importance.

Higher standards of accountability: Along with a change of focus towards "progress" instead of "process" comes a need for tools to measure achievement. The No Child Left Behind Act, signed into law this past February, requires all states to establish a statewide accountability system to measure "adequate yearly progress" in all students, including students with disabilities. This reinforces the IDEA '97 requirement that students with disabilities must have access to the general curriculum and must be included in state-wide assessments.

Training and retention of educators: Qualified special education teachers are increasingly difficult to attract, and general education teachers often need more information than they receive about how to address the needs of special education students in their classrooms. Educators are often eager for more support in the area of special education; the question is how to provide it. It is difficult to know how best to recruit and retain qualified professionals, but most people agree that this is key to providing students with the level of education necessary for them to succeed.

For more information on IDEA reauthorization, visit http://edworkforce.house.gov/issues/107th/education/idea/idea.htm.

To submit comments or suggestions to the Subcommittee on Education Reform, visit http://edworkforce.house.gov/issues/107th/education/idea/ideacomments/ideaform.htm.

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in Exceptional Parent.
How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly.

Be sure to tell them you saw their ad in Exceptional Parent!

Senate Bill for Disabled Children

Families of children with severe disabilities will soon be eligible for Medicaid benefits, pending Congressional approval of bill # S-321.

Approved by the Senate Finance Committee on July 11, 2002, the bill would allow families currently ineligible for the program because of high income levels to participate. About 200,000 children would benefit from this measure.

Families with annual incomes up to 250% of the poverty level, or $45,000 for a family of four, would be eligible. Currently, children under six are given access to these benefits only if their family's income is up to 133% of the poverty level, and children 6-18 have access only at 100% of the poverty level.

Sen. Charles Grassley (R-Iowa), the bill's sponsor, said the bill aims to prevent families from spending down their incomes or quitting their jobs to qualify their children for Medicaid.

National Disability Mentoring Day

National Disability Mentoring Day: Career Development for the 21st Century, will be commemorated on Wednesday, October 16, 2002.

NDMD's purpose is to draw attention to the importance of encouraging young people with disabilities to obtain job skills. Students and job seekers with disabilities, with the help of NDMD and mentors in the community, can learn and obtain careers.

Along with the American Association of People with Disabilities (AAPD), local communities can organize activities with volunteers at public and private places of employment.

If you are interested in participating, or coordinating activities in your community, please visit http://www.aapd-dc.org/mentor.html.

Definition of Mental Retardation

"Mental Retardation is not something you have, like blue eyes, nor is it something you are, like short or thin. It is a particular state of functioning..."(AAMR, 2002).

The American Association on Mental Retardation has recently released its tenth edition of "Mental Retardation: Definition, Classification, and Systems of Support." This edition incorporates new features and expands others to create a multidimensional system for diagnosing, classifying and planning supports that will improve the quality of life for people with mental retardation.

The AAMR will be holding two 2-day training sessions on their new definition in September 2002 in New Orleans, and October 2002 in Washington, DC.

For more information, please visit http://www.AAMR.org

BabySpa

For parents searching for baby care products without harsh ingreidients, BabySpa's Natural Touch products provide a solution. BabySpa designs its products to promote wellness and bonding between parents and their babies. It offers a variety of infant massage oils, shampoos, soaps and lotions, all made from natural ingredients such as aloe vera, lavender, cucumber, and jojoba oil, among others.

In additoion to cleansing products, BabySpa offers soothing CD's, cuddly textiles, and creative gift sets, all of which can be found in specialty shops, natural food stores and pharmacies.

BabySpa donates a portion of its profits to treat babies and children infected with HIV/AIDS.

For more information, or to order online, visit http://www.BabySpa.com.

National Council on Disability

Five nominees to the National Council on Disability were confirmed by the U.S. Senate on July 26, 2002. The NCD is an independent federal agency that makes recommendations to the President and Congress on disability policy.

The nominees are:

- Lex Frieden of Houston, TX, as chairperson. Mr. Frieden is senior vice president at the Institute for Rehabilitation and Research. He is also a professor of physical medicine and rehabilitation at Baylor College of Medicine.
- Young Woo Knag, Ph.D. of Munster, IN. Dr. Kang is an author and the founding president of Education and Rehabilitation Exchange Foundation International.
- Kathleen Martinez of Oakland, CA. Ms. Martinez is deputy director of the World Institute on Disability, which is dedicated to promoting independence and societal inclusion of people with disabilities.
- Carol Hughes Novak of Tampa, FL. Ms. Novak has a child with severe cerebral palsy, and was a member of the Bush-Cheney 2000 Disability Advisory Coalition.
- Patricia Pound of Austin, TX. Ms. Pound is the executive director of the Texas Governor's Committees on People with Disabilities. She is the founding president of the Coalition of Texans with Disabilities and a current member of the National Association of Governor's Committees on People with Disabilities.

For more information, contact Mark Quigley at 202-272-2004.

Straight From Her Heart

Victoria Guillot knows what it's like to be scared. This creative and caring 10-year-old has written a book about her feelings and fears of having diabetes.

Straight From Her Heart, Victoria's homemade booklet allows the reader to share in the thoughts of a child with an illness. Victoria wants to reach out to other children, to let them know they are not alone.

To order your copy, send a check or money order for $12.95 to:

Straight From Her Heart
122 Desoto Road
Plaucheville, LA 71362

or send email to:

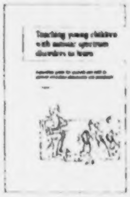
Roadblocks to Learning: Understanding the Obstacles that can Sabotage Your Child's Academic Success
By Lawrence J. Greene
EP Library Code: TW9011ED Price: $16.95

This general resource for parents aims to explain and define counterproductive behaviors and learning disorders that block a child's academic progress. The book lists common symptoms of each difficulty, defines important terminology and suggests testing protocol and remediation strategies (when appropriate). Resources provided include a bibliography and 2 appendices.

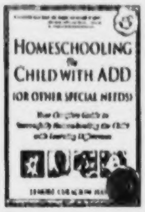
Wrightslaw: Special Education Law
By Peter W.D. Wright
& Pamela Darr Wright
EP Library Code: HP0037SE or HP0037SECD (with CD ROM)
Price: $29.95 or 39.95 w/CD-ROM

This sequel to *Wrightslaw: From Emotions to Advocacy* (see EP June 2002) is divided into five parts. Section 1 discusses law itself and provides an overview of special education law. Section 2 deals with the Individuals with Disabilities Education Act of 1997, providing the text of IDEA, an overview and a table that breaks down its regulations. Section 3 outlines the Rehabilitation Act of 1973 (Section 504), and Section 4 details the Family Educational Rights and Privacy Act. Section 5, entitled "Case Law," gives an overview of how to apply case law to advocacy.



Teaching Young Children with Autistic Spectrum Disorders to Learn: A Practical Guide for Parents and Staff in General Education Classrooms and Preschools
By Liz Hannah
EP Library Code: NA2099AT Price: $21.95

This book of activities provides tips to help develop early communication skills, prerequisite skills for early learning (such as sitting down, concentrating, etc), literacy skills, social interaction skills, imagination and flexible thought. Behavior support strategies are also covered, with the underlying reminder that difficult behavior is a reflection of difficulties children are experiencing. Also emphasized are the TEACCH method (Treatment and Education of Autistic and related Communication-handicapped Children) and structured teaching (showing the child exactly what the task is and what will happen when it is finished). References for further reading and additional resources conclude the book.



Homeschooling the Child with ADD (Or other Special Needs): Your Complete Guide to Successfully Homeschooling the Child with Learning Differences
By Lenore Colacion Hayes
EP Library Code: PR5691HS Price:$16.95

Hayes' writing covers the path many parents take when considering homeschooling as an alternative education option. It begins with diagnosis of the child, developing confidence to teach your child and removing your child from school. Then Hayes walks through the process of selecting learning materials, handling family and friends and where to go for homeschooling support. Each chapter concludes with a list of books, organizations, periodicals and/or web sites that can be used as resources.

Including Students with Severe and Multiple Disabilities in Typical Classrooms: Practical Strategies for Teachers, 2nd Ed.
By June E. Downing, PhD
(with invited contributors)
EP Library Code: PB5192ED Price: $39.95

This guide to inclusion provides the rationale for inclusion coupled with instruction ideas for the general education classroom. According to Downing, the first step lies in "determining individual abilities and how to best support students." Subsequent chapters develop this idea and apply it to preschool students, elementary students, middle school/junior high students and high school students. Four appendices at the back of the book outline systematic teaching resources, adaptive communication resources and videotapes on inclusion.

Nonverbal Learning Disabilities at School: Educating Students with NLD, Asperger Syndrome and Related Conditions
By Pamela B. Tanguay
EP Library Code: TF9416AS Price: $24.95

As a mother of a child with NLD, this author provides valuable resource. The book not only explains NLD, but also addresses environmental issues that will affect the child at school, suggests possible teaching strategies and discusses social and emotional functioning. Each chapter ends with a summary that outlines the basic points emphasized. Appendices that conclude the book provide a glossary of terms, annotated bibliography, internet resources and helpful organizations.

PART XIV

Oral Health for Adults with Disabilities

Dental treatment for adults

Paul Farsai, DMD, MPH, Joseph Calabrese, DMD

Approximately 50 million Americans have some type of disabling condition. "Special care dentistry" is a term commonly used for addressing the oral health needs of a person who is medically compromised or an individual with some type of mental, physical or developmental disability. This type of dental treatment may be provided in private practice, community health centers, group homes, long-term-care facilities, skilled nursing facilities or hospitals. It typically involves modifying the process of the dental examination and of the required dental treatment to accommodate the person's disability.

Special care dentistry may include consulting with the person's physician, coordinating dental treatment with other care providers, assisting a person with the aid of the family and direct support professionals (DSPs), adaptations to the treatment procedure, communicating through an interpreter and treatment planning with the person to mitigate future oral health problems.

Oral diseases for individuals with disabilities do not differ from those of individuals without disabilities. Various factors related to the disability, however—such as grasping a toothbrush or articulating the source of oral pain—make it more difficult to prevent and treat dental disease. Keep in mind that, as children and teenagers, adults with disabilities are likely to have had inadequate oral health care. Thus treatment may also differ, because the disease is typically addressed at a later stage, and must often be adapted to fit the needs of the individual's physical and cognitive impairments.

Adults with disabilities are subject to the same ailments and chronic diseases (eg, heart disease, lung disorders, arthritis, type II diabetes) as adults without disabilities—except that these conditions may manifest themselves 15 to 20 years sooner in people with disabilities. This means that a 30-year-old adult with mental retardation/development disabilities (MR/DD) may have a level of oral health similar to that of a 50-year-old person without disabilities.

Common changes seen as people with disabilities age

Certain oral conditions appear more often in persons with specific disabilities, partly because of the disability itself, but also because of behavior patterns that accompany the disability.

For example, in many people with MR/DD, the teeth erupt in an altered pattern, which may result from over-retained primary (baby) teeth or even the malformation of the teeth. If left untreated, delayed eruption patterns will lead to poor alignment and positioning (malocclusion) of teeth.

Broken teeth are commonly seen in individuals with disabilities; they may result from falls caused by poor ambulatory skills or seizure disorders.

continued on page 112

continued from page 111

Another cause might be the behavioral tendencies of repetitive body movements and fixation on certain tasks that are characteristic of people with autism. These tasks typically include chewing on hard, non-edible objects that tend to break teeth.

Dry mouth (xerostomia) is a common and often-overlooked oral health problem. Once considered an inevitable consequence of aging, it is now known that saliva production remains essentially unchanged in healthy elders. Yet the secretion of saliva may be indirectly dependent on individuals' systemic health as well as the number and type of medications that they are taking. Medications used to treat high blood pressure, heart disease, diabetes, allergies, depression and many other conditions have been found to cause dry mouth.

Medications used to treat high blood pressure, heart disease, diabetes, allergies, depression and many other conditions have been found to cause dry mouth.

Saliva maintains the oral environment by limiting bacteria, strengthening tooth enamel, lubricating tissues and enhancing taste sensation. Diminished salivary flow is associated with increased burning and soreness of the oral tissues, difficulty in chewing, swallowing and speaking, oral infections and overall mouth feel, all of which can adversely affect food selection and dietary compliance. Dry mouth can further contribute to the accumulation of food debris around teeth, which can lead to advanced stages of tooth decay, gum disease or even tooth loss.

Cavities or caries (tooth decay) are the result of bacteria breaking down the hard tooth structure. This process typically occurs when food debris and bacteria are not adequately removed from the teeth. A diet high in sugar and carbohydrates also increases the incidence of tooth decay.

Decayed roots (root caries) occur when gum recession and/or bone loss cause the exposure of the roots of teeth, leading to decay on the root surface of the tooth. The exposed root is more susceptible to root caries if oral hygiene is not adequate.

Gum disease (gingivitis) appears as red, inflamed and/or bleeding gum tissue. The inadequate removal of food and bacteria from the gum causes gingivitis. The appropriate removal of debris from the gum tissue can reverse the condition. If left attached to teeth for longer periods, bacteria can cause irreversible bone loss and other tissue abnormalities (periodontitis). In its more advanced stages, gingivitis leads to tooth mobility and even tooth loss.

Missing teeth (tooth loss) can be an upsetting ordeal to an individual, particularly if the missing teeth are not replaced. The three most common causes of tooth loss are advanced tooth decay, advanced periodontal disease, and trauma from falls or accidents. Many options are available today for persons seeking treatment to replace their missing teeth.

Tooth replacement (dental prosthesis) is done to fill the spaces left by missing teeth. Restored chewing ability and improved aesthetic value can play an important role in helping to improve a person's quality of life. Following a clinical examination, appropriate treatment options should be discussed by the dentist and the person, family member or DSP.

Bad breath (halitosis) is caused by a number of factors. It often results from upper respiratory conditions caused by excessive mucous buildup, infections or even poor digestion. However, halitosis can very easily originate in the oral cavity because of inadequate oral hygiene, large cavities or even advanced periodontitis.

Food pocketing (pouching) is a condition in which individuals who are unable to chew or swallow accumulate their food between their cheeks/lips and their gums. Pouching of food debris and medications not only results in significant dental and medical consequences but can also lead to malnutrition.

Regurgitation (rumination) is a characteristic seen in many individuals with mental disabilities. Individuals swallow their food and then regurgitate it with the stomach fluids and acids, leading to severe indigestion and malnutrition. In persons who have excessive drooling of saliva, dental professionals should also consider problems with pouching and regurgitation.

Appropriate dental care for adults with disabilities

Following a comprehensive clinical examination, the dentist will present treatment options to the person, family member or DSP.

The dental treatment plan should be formulated according to accepted den-

EC 1088

tal practice and take into consideration such basics as:

- Addressing the person's immediate pain or infection
- The person's mental status—the level of disability, understanding and communication, and psychological and social needs
- The effects of the current oral condition on the quality of life
- Physical impairments
- The person's capacity for self-care and care management

Oral hygiene

Brushing teeth should ideally take place in the morning, after each meal and before bedtime. Toothbrushes can be modified to enable people with physical and mental disabilities to brush their own teeth and decrease the incidence of pouching. Certain electric toothbrushes may improve compliance. Use of fluoride toothpaste or gel has been shown to maximize the effects of a good regimen for oral health promotion and disease prevention.

Flossing should be accomplished daily; however, it may be difficult for individuals with movement disorders and other disabilities to do so, and a second person may be needed. Flossing helps prevent the accumulation of food debris between the teeth that leads to various types of dental disease.

Mouthwashes or rinses are beneficial in managing gingivitis and periodontal disease under the direction and care of a dentist or a hygienist. Mouthwashes should be swished and spit out (never swallowed); persons who might swallow a rinse could benefit from its application with a toothbrush or cotton swab rather than rinsing. A prescription mouthwash with the active ingredient chlorhexidine is recommended, as it has been shown to have antibacterial qualities. This mouth rinse is also recommended as an adjunctive aid in managing gum disease. Rinses that contain fluoride have also been proven to be effective in preventing cavities.

Dietary counseling is necessary for long-term prevention of dental disease as well as weight management and overall health. This is especially significant in individuals with a compro-

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

Coming Soon!

HYPERBARIC OXYGENATION FOR THE COMATOSE CHILD

There is some hope for the comatose child suffering from severe brain injuries, cerebral palsy, or anoxic encephalopathy. Children with Glasgow Coma scales from 3-5 present tremendous financial and emotional burdens, since these little ones may live for many years. When considering care of tracheotomy, gastric tube for feeding, physical therapy, occupational therapy, speech therapy, nursing care, recurrent hospitalizations, medications, vans, and modifications to the home, expenditures may represent multi-million dollars.

Intensive hyperbaric oxygenation is no miracle, but it provides some hope. In certain instances the child is able to communicate verbally, by computer or word board. Eighty percent have the G-tube removed and seventy percent have the tracheotomies closed. Frequently, bowels become normal and nutrition is re-established. Routine monthly medications are reduced and hospitalizations are markedly decreased. Although few children will return fully to society, substantial improvements will give them a better quality of life in addition to a ninety percent reduction in overall costs.

For more information on hyperbaric oxygenation therapy and life planning, call the Ocean Hyperbaric Neurologic Center at (800) 552-0255.

Hyperbaric Oxygenation for Cerebral Palsy and the Brain-Injured Child..

by R. A. Neubauer, M.D.

Dr. Neubauer's new book is a complete guide written for the professional as well as the caregiver of exceptional children. The book describes the latest information on hyperbaric oxygenation therapy including improved brain function as visualized through functional imaging. Clinical and scientific data along with references are included.

continued from page 113

mised health status and individuals having difficulty chewing or swallowing.

Treatment goals

The first appropriate treatment goal is to improve or stabilize the oral condition of the person who has not received dental care recently. Stabilization of the oral condition keeps individuals who have not had routine care free of acute disease.

Most of the acute oral conditions that are commonly seen in adults who have physical, mental or developmental disabilities have been discussed above. However, a clinical examination may reveal other oral conditions that will need appropriate—even immediate—care. This is why the importance of a comprehensive clinical exam cannot be over-emphasized.

Medicare is the largest federally funded health care system in the United States, yet it does not include a specific dental component.

Once the acute disease is stabilized, the next step will be the restoration of the oral health and function. An appropriate maintenance schedule to oversee the person's reestablished oral health can then be designed.

Disease prevention and maintenance of the mouth

The first step in obtaining compliance with oral hygiene recommendations is to promote the person's involvement through education and demonstration tailored to the person's level of impairment. This maximizes acceptance of the oral condition and supports independence vis à vis oral health. If persons are unable to participate in the educational/instructional process, family members and DSPs are encouraged to assume this responsibility.

Educating family members and DSPs is also critical to ensure appropriate and regular supervision of daily oral hygiene. The person's oral care should be monitored daily and oral care assistance provided as needed.

Certain adaptive aids may improve the manual dexterity and physical manipulation of a toothbrush: large-sized toothbrush handles, for example, or making cuts on either end of a racquetball or tennis ball and sliding the handle of a toothbrush through the two cuts. Other useful and appropriate material used in the oral health care of an individual with disabilities may include electric toothbrushes, antimicrobial mouth rinses and oral lubricants that resolve oral discomfort associated with the gum tissues.

Barriers to treatment for adults with disabilities

Aside from the oral health care supports needed by many individuals with disabilities there are other significant barriers that prevent access to proper oral health care.

Insufficient numbers of dental health providers: One barrier includes the low number of dental health providers trained specifically to treat people with disabilities. Most dentists already treat adults with certain physical impairments and medical conditions. As health care improves and many once-acute and -advanced conditions become chronic or manageable, the number of persons with disabilities will continue to grow and to seek care from traditional private or community-based services. At the same time, the expected lifespan of individuals with disabilities continues to increase because of improvements in medical and social services.

Informed consent and treatment decisions: A major determining factor in providing any type of treatment for a person with a disability is the need for dental professionals to obtain informed consent for treatment. Most individuals with MR/DD have legal guardians whose consent is required before the proposed treatment can begin.

Inadequate financial coverage: Poor reimbursement for dental services is clearly a hinderance to properly addressing the dental needs of people with disabilities. Lack of adequate financial coverage may dictate certain compromises in dental treatment plans.

Medicare is the largest federally funded health care system in the United States, yet it does not include a specific dental component.

Medicaid can be a source of payment for dental services, but not all state Medicaid plans offer dental care coverage for adults; typically, coverage is limited and varies across states. Also, the majority of dentists in most states are not Medicaid providers, so the scope of dental services through Medicaid is even more limited.

Further complicating Medicaid coverage in many states are the eligibility restrictions for adults based on the level of disability. In other words, adults who may have a milder yet still significant level of disability may not be eligible for Medicaid.

Sometimes reimbursement, although at a lower level, is available for certain types of dental care through Medicaid Waiver Programs, grants through local and state dental societies/associations

Circle #36 or visit www.eparent.com/adinfo

or through the state Developmental Disabilities council. State dental societies are good sources of more information about available programs.

State-run agencies such as public health clinics and community health centers can also serve as resources for obtaining access to oral health care. Many individuals with disabilities have access to social workers, support coordinators or caseworkers who may be able to assist in obtaining full or partial funding for specific dental services.

Why Oral Health?

There is a significant relationship between general health and oral health. For example, oral health and nutrition are reciprocal. The condition of the teeth and supporting tissue has an effect on nutritional intake, quality of life and systemic health. At the same time, poor nutrition can weaken the teeth and supporting tissue. The oral cavity is often the site where signs and symptoms of many systemic diseases are first manifested. Oral health is much more than healthy teeth and gums; it is integral to both general health and the quality of life.

For a list of sources for additional information on oral health care for adults with disabilities, please email your request to epedit@aol.com, fax it to 201-489-0074, or mail to Adult Dentistry, Exceptional Parent, 65 East Route 4, River Edge, NJ 07661. EP

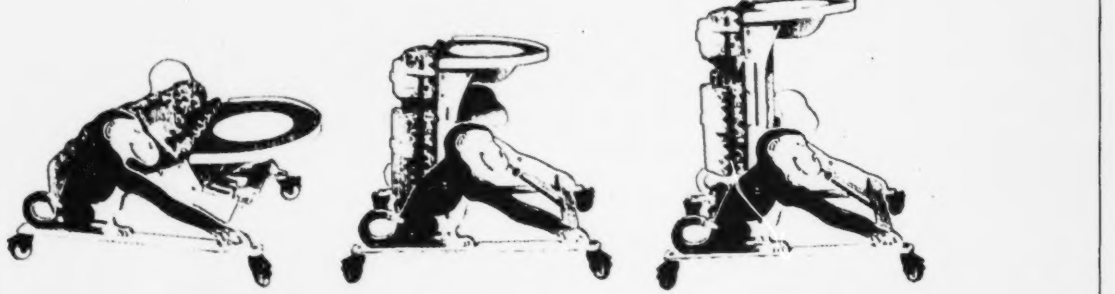
Joseph Calabrese, DMD is an Assistant Professor in the Department of General Dentistry, Boston University Goldman School of Dental Medicine; Clinical Instructor in the Department of Oral Health Policy and Epidemiology, Harvard School of Dental Medicine; and the Director of Dental Medicine at Hebrew Rehabilitation Center for the Aged in Boston, MA. He also has a private practice.

Help your child rise to any occasion.



Like you, Jenx and Bodypoint Designs would never do anything to inhibit your child's ability to participate in the world. And that's precisely why we'd like to share another great feature of the unique positioning tools that Jenx has created: Adjustability.

With Jenx, you can raise or lower your child to accommodate just about any activity they're involved in. Each Jenx animal has a range of adjustments that promote positive therapeutic benefits, the most important being that your child can finally feel part of the group.

Being included does wonders to help your child rise to any occasion. And whether the group is on the floor or standing at the play table, Jenx helps make your child a part of it all. Just one more reason to make Jenx your first choice in positioning equipment.

Changing
Lives
Forever

The Anne Carlsen Center for Children offers a 60-year tradition of residential, therapeutic and educational services on one campus. Our individualized services include care for children and young adults coping with cerebral palsy; orthopedic, vision and hearing impairments; autism, pervasive and other developmental disorders; and many other medical challenges. Our multidisciplinary team can reach out to you by conducting evaluations in your child's home and school setting.

THE SPECIAL NEEDS BOOKSTORE

AUTISM

THINKING IN PICTURES
My Life With Autism
TEMPLE GRANDIN WITH
A FOREWORD BY OLIVER SACKS
The author is a gifted animal scientist who has designed one third of all the livestock-handling facilities in the US. She is also autistic, a woman who thinks, feels, and experiences the world in ways that are incomprehensible to the rest of us. In this unprecedented book, the author delivers a report form the country of autism. Writing from the dual perspectives of a scientist and an autistic person, we learn how the country is experienced by its inhabitants and how she managed to breach its boundaries to function in the outside world. What emerges is a document that sheds light on the riddle of our common identity.
RH118AT $12.00

NEW

AUTISM IN THE EARLY YEARS
Resource Materials for Teachers: A Practical Guide
VAL CUMINE, JULIA LEACH AND GILL STEVENSON
Designed to provide parents and professionals with an insight into the nature and educational implications of autism, particularly as it presents in very young children. Also aims to equip Early Years practitioners and parents with knowledge of a range of intervention strategies to promote learning, social development, communication and appropriate behavior.
TF5992AT $25.95

NEW

CREATING A "WIN-WIN IEP" FOR STUDENTS WITH AUTISM
A How-To Manual for Parents and Educators
BETH FOUSE, PH.D.
This Second Edition, has been written to provide parents and families of students with autism necessary information and skills to meet the challenges of the IEP process. This book takes readers through the child-centered educational process from the stages of initial diagnosis to implementation ad of student's individualized educational programs. Practical suggestions are provided based on federal and state legislative requirements, case law, and the many years of experience the author has in working with the process as a teacher, special education administrator, regional special education consultant and university instructor.
FH7287SE $29.95

A WORK IN PROGRESS
Behavior Management Strategies and a Curriculum for Intensive Behavioral Treatment of Autism
RON LEAF AND JOHN MCEACHIN
A superb collection of ideas and programs for building skills as well as strategies for dealing with challenging behaviors. It is a comprehensive guide presented in user-friendly language so parents and professionals can easily understand and use this valuable resource.
DR6600AT $42.95

IEP

PLANNING FOR SUCCESS
The College Application Process for Students With Learning Disabilities
The college admission process can be a confusing and overwhelming experience for students with learning disabilities and their families. This comprehensive video enables you to see the college application process from the very beginning. It shows early planning, college visits, the essays, and how to choose the best school for you.
LD201LD $79.99

THE COMPLETE IEP GUIDE
How to Advocate for Your Special ED Child
LAWRENCE M. SEIGEL
A comprehensive step by step guide through the entire IEP process that provides encouragement to the reader as it takes a complicated process and makes it easier to understand. Provides instructions, suggestions, strategies, resources, forms and much more.
NL001SE $24.95

HOW TO WRITE AN IEP
JOHN ARENA
Parents, teachers, administrators and others involved in IEP preparation and implementation will profit from this brief, easy-to-use, handbook. This text will serve as an invaluable reference for making sure all factors of consequence are given the consideration they require.
NEW THIRD EDITION
AT1649SE $19.95

EDUCATION

COOPERATIVE LEARNING AND STRATEGIES FOR INCLUSION
Celebrating Diversity In the Classroom
JO ANNE W. PUTNAM
This guide shows educators how to make group learning strategies work in their classrooms. There are chapters written by a distinguished array of professionals who reveal the real educational benefit of a cooperative learning environment.
PB167ED $26.95

NEW

EFFECTIVE COMMUNICATION
Collaborative Practices For Educators Strategies for Effective Communication
PATTY LEE, ED.D.
This new revised edition includes 60 strategies and 180 practice activities designed to improve communication and collaboration skills. The activities may be used in any order allowing you and your colleagues to focus on one specific area or work in several areas simultaneously! Covers six (6) critical areas: Developing Expectations; Preparing Ahead; Understanding Perspectives; Listening; Asking Questions and Speaking Clearly.
PP5261ED $19.95

DYSLEXIA

DYSLEXIA, FLUENCY, AND THE BRAIN
MARYANNE WOLF
Consider the time it takes for the brain to process written language. What impact does the brain's processing time have on reading development? What are the relationships among processing time, reading fluency, and dyslexia? Can time and fluency related problems be changed? How should intervention be designed to address the issue. This monumental resource presents evidence indicating that many dyslexic children have a second core deficit in rate of processing linguistic differences in multiple areas. This book has been constructed to bring several levels of evidence and types of research to bear on these questions.
YP2602DY $30.00

NEW

LEARNING ABOUT LEARNING DISABILITIES
Second Edition
BERNICE WONG
Targeted for the advanced student and professional this text covers a wide range of topics to ensure a comprehensive and balanced coverage of important areas in learning disabilities. Included are conceptual issues, basic research in memory processes and social aspects of learning disabilities intervention research in academic areas and nonacademic areas, issues in service delivery and a life span perspective.
ACP5321LD $59.95

PB166GN **$23.95**

NEW

Pathways to Learning in Rett Syndrome
Jackie Lewis and Debbie Wilson
Parents and Teachers of girls with Rett Syndrome will welcome this extraordinary book that offers accessible advice on the special education needs of these girls. It also assists teachers in developing a working knowledge of the syndrome and suggests particular strategies in planning a curriculum which may help overcome the specific difficulties within the diagnosis.
TT5333RS **$26.95**

FOR YOUNG PEOPLE

NEW

Never Sell Yourself Short
Stephanie Riggs
with photographs by Bill Youmans
Josh is a stereotypical teenage boy. He plays sports, spends time with his friends, and can't wait to drive. Josh is also short statured, and in this inspiring essay he talks about life in a world that is scaled for people much taller than he. His story is inspirational for everyone with obstacles to overcome in order to chase their dreams.
AW5630YP **$15.95**

NEW

Special People Special Ways
Arlene Maguire; Illustrated by Sheila Bailey
This book presents a positive image of persons with disabilities using a delightful rhyme and rich watercolor illustrations. It shares the message that even though each of us may have something different about us, we share many commonalties.
FH7651GN **$14.95**

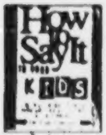
NEW

Taking Cystic Fibrosis to School
Cynthia S. Henry
with illustrations by Tom Dineen
This heartfelt children's story helps to explain for kids and their parents what cystic fibrosis is, how it is treated, and what activities children can participate in with others.
JJ3094YP **$11.95**

NEW

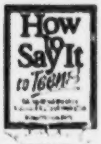
Allie Learns About Alzheimer's Disease
A Family Story About Love, Patience, and Acceptance
Kim Gosselin
with illustrations by Tom Dineen
This touching story about a girl and her relationship with her grandmother who suffers from Alzheimer's Disease is an excellent way for parents to introduce such difficult topics such as family healthcare to their children.
JB3159AZ **$14.95**

PARENTING



NEW

How to Say It to Your Kids
The Right Words to Solve Problems, Soothe Feelings, and Teach Values
Dr. Paul Coleman
This insightful and beautiful parenting manual is filled with a wealth of information that you can immediately use to transform your children's lives. It accurately predicts the traps many fall into and offers practical and sensible advice for dealing with many issues parents face when raising any child.
PH1773PA **$14.00**



NEW

How to Say It to Teens
Talking About the Most Important Topics of Their Lives
Richard Heyman, Ed.D.
If men are from Mars and women are from Venus, then teenagers are from an entirely different universe. Here you'll discover surprisingly easy ways to keep the lines of communication open throughout your child's turbulent adolescent years.
PH1883PA **$16.00**

The Don't Sweat Guide for Parents
Reduce Stress and Enjoy Your Kids More
Richard Carlson, PhD
This insightful guide provides suggestions for enjoying your children more while being less stressed and more present with them in every moment of their lives. Strategies that are discussed include admitting that you could use some help, learning to take a breather, keeping the job at the office, and many more.

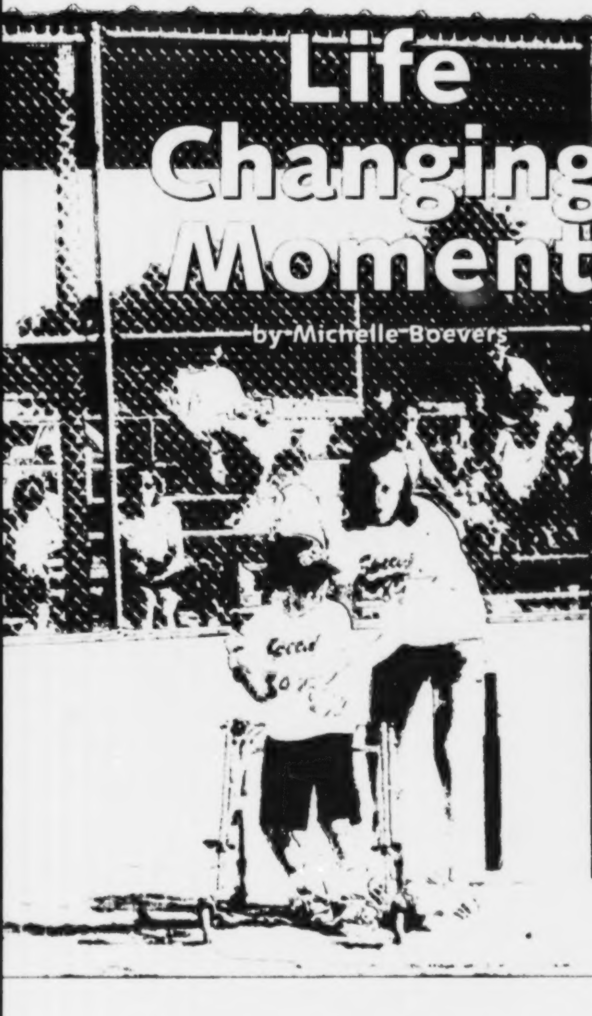
Life Changing Moment

by Michelle Boevers



People are different. If not by looks, then by their personalities. People judge. That's a fact. I judged other people until my brother Max came into my life. That's why he has changed my life. He has taught me about the importance of diversity.

The first time I held my brother in my arms, I thought to myself, "I've got so much to teach this little brother of mine." I soon found, however, that he would be the teacher. For example, my brother has taught me about loving people for who they really are, no matter if they have a disability or not. My brother has cerebral palsy, which is a condition involving the brain's sense of touch and balance. He uses a walker to help him walk. Even though he has CP, he can still run, jump, laugh and play like anyone else. To me and my family, he is normal. He also plays on a baseball team called the Special 89ers. He loves running around the bases as the crowd cheers him on. I just love watching the mile-wide smile on his face as he slides across home plate to score a run. He has been my teacher, showing me that anything is possible; for instance, just because someone cannot walk does not mean that they cannot score home runs! He has taught me to love him for his heart because he tries so hard.

Max has also taught me about diversity. Before he came along, I lived in a perfect little world; there were no trips to doctors in St. Louis or Salt Lake City. There was just my mother, my father and me. Max was this little kid dropped into a family of athletic stars, and of course I thought he would never fit in or that he would be the black sheep of the family. He fooled me though! Even though he puts tremendous effort into everything he does, he still does everything that we do. Ultimately, he has taught me that even though you may look different from others, it is what is inside that counts.

I used to judge people by the clothes that they wore. But since knowing Max, I can honestly say I don't do that anymore. Now I judge people by their hearts. This is important not only for people you know, but also for people you don't know. Every time I think about someone, I think about how Max would handle the situation. He does not judge.

Good things come in small packages. That is my brother Max. Even though he is younger than I am, he has taught me more than anyone else has. I love and admire him for that. Not only is he my brother, but he is my best friend, role model and teacher. EP

MOM'S TURN

Lisa Boevers, mother of Michelle and Max, writes: A mother always worries about family dynamics. When one of your children has special needs, it puts a whole new twist on the family structure. Many times our daughter has had to take a back seat to the needs of our son. I often worry about how this will affect her. When I read this essay, which Michelle wrote for her 9th grade English class, it warmed my heart. She wrote a loving tribute to her brother, but also showed the positive that can come from a special situation.

Submit your Children's Page to: EP, ATTN: CHILDREN'S PAGE, 65 East Route 4, River Edge, NJ 07661. Be sure to include your name, address, daytime telephone number and e-mail address! ***Now on the Web!*** We now include **Familiar Faces** and **Children's Page** on our Web site, http://www.eparent.com. Please send us your photographs with the understanding that doing so gives EP permission to put the photos on the EP Web site, exactly as they appear in the magazine and with the same text.

A Better Bedtime Story

The Vail Enclosed Bed

Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt. Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

For a FREE catalog, call:
1-800-235-VAIL

Vail Meadows Therapeutic Riding Center

Corporate Sponsor of Vail Meadows Therapeutic Riding Center

Happy challenges for challenged riders.

Ask about Our Decorator Accessories.

"Allison had trouble falling asleep due to neurological damage. But the Vail bed has changed our lives. She loves it! And it's like her neurologist told us: the bed has conditioned her to fall asleep."

IBM

Independence.
Empowerment.
That's accessibility from IBM.

IBM knows the independence accessibility can bring. For over a decade, IBM has pioneered the cause to open the world of information technology to more people, regardless of ability or disability. Our accessibility product solutions have become valued tools for teachers, therapists and people with disabilities. With products such as IBM Home Page Reader, a self-voicing Web browser, IBM has given blind and low vision people greater access to the Web. And our work continues. Soon, we will be doing even more. The vision at IBM is to help people feel more connected, more productive and more empowered in their lives. IBM understands the challenges. We're here to help.

For more information about IBM accessibility solutions, and to download a 30-day trial of Home Page Reader at no charge, visit **www.ibm.com/able**.

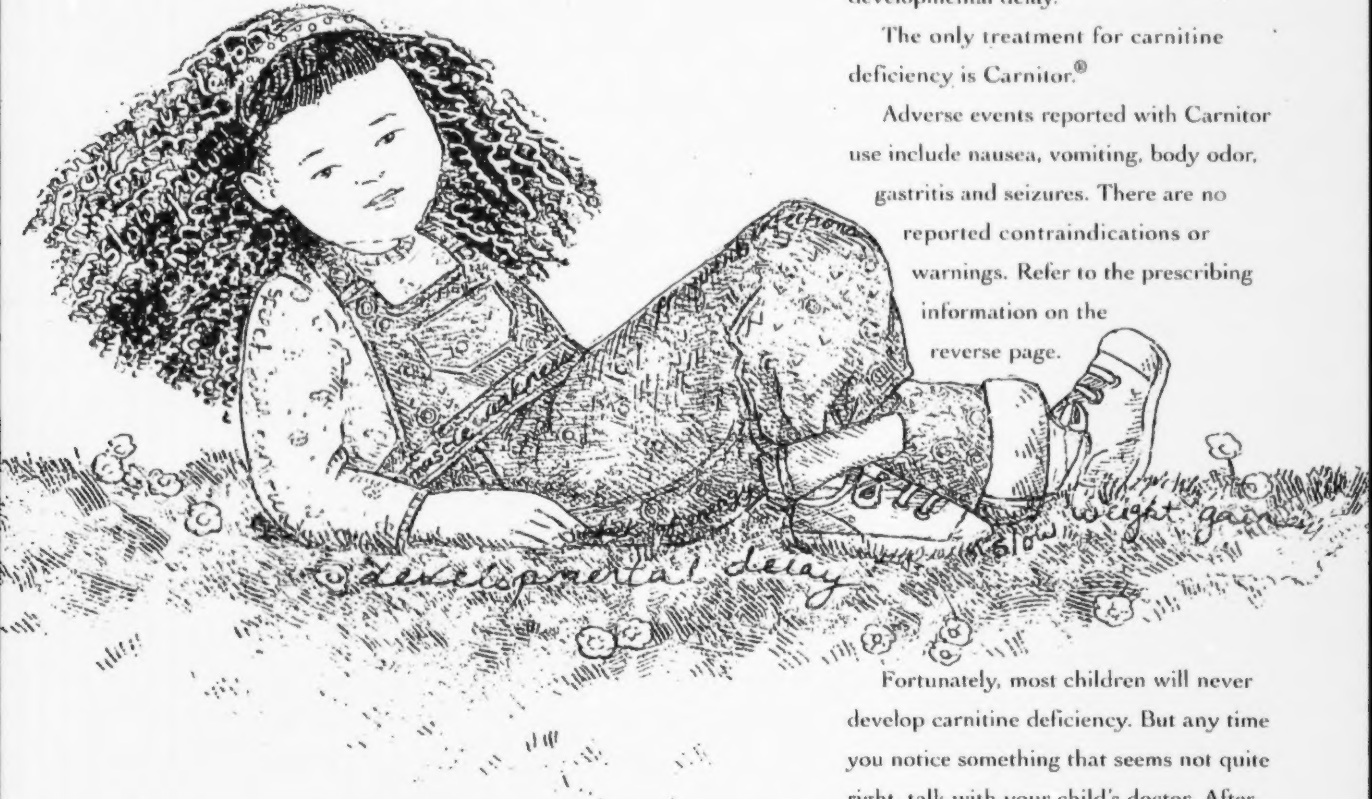
CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?



No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.

Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

1105

©2000 Sigma-Tau Pharmaceuticals, Inc. All rights reserved. PA 10

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses [illegible] be of benefit. Dosage should start at 1 g/day, (10 m[illegible]y), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

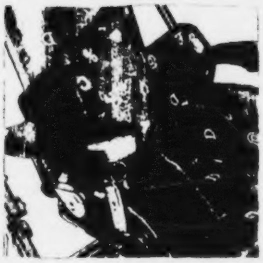
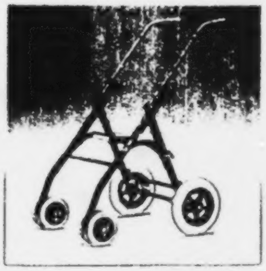
PANDA FUTURA





R82's Panda Futura is a modular seating system designed for children who require positioning accessories. When combined with our indoor and outdoor mobility bases, the Panda is the ideal product for eating, playing, resting, and transport activities.

A reclining back and tilt-in-space feature positions the body in proper alignment. This enables the caregiver to adjust the seat to meet the changing postural needs of a child throughout a typical day. From an anterior tilt for functional activities, to a reclined resting position the Panda Futura does it all.

Accessories include lateral supports, abductors, vests, belts, harnesses, trays, knee supports, head rests, shoulder retractors, armrests, and a variety of footrest options. Growth pads are included, and optional seat and back extensions can be purchased to enable your child to use this system for several years.

Quality for life

The Bugsy walker's maximum adjustability and solid, lightweight construction provide safety, convenience, and functionality like no other.

The Bugsy's highly adjustable design encourages active postural control during standing and walking, while also promoting a more natural movement. Unlike other walkers, Bugsy's solid rubber wheels feature stainless steel ball bearings for smooth, easy maneuverability. The anti-reverse wheel design prevents inadvertent backward rolling for safety. Lightweight construction and a quick fold-up feature provide easy handling and storing.

Contact your Otto Bock Sales Representative (U.S. 1-800-328-4058 or Canada 1-800-665-3327) to see the Bugsy pediatric postural walker firsthand.

CONTROL

Handlebars are height and depth adjustable to accommodate growth and gait patterns.

Optional positioning aids, such as upright handlebar with forearm pads provide stability and postural support for children unable to use the standard handlebar.

Lightweight and easily folded for added convenience.

Optional swivel wheel locks and rear friction brakes provide directional control and extra safety.

Soft, solid rubber wheels with stainless steel ball bearings provide easy rolling and maneuverability even under heavy pressure.

Optional hip pads and seat

Optional back support and handle grips with wooden stops

ACCESS TO ORPHAN DRUGS THREATENED FOR MEDICARE PATIENTS TREATED IN HOSPITAL OUT-PATIENT CLINICS. THOUSANDS OF PATIENTS PLACED AT RISK

EP's mandate is to take a stand on issues when the lives and well being of people with disabilities and special needs are unduly compromised. We do not treat this lightly and only get involved after careful consideration of all the facts. We now find ourselves having to take yet another position on Orphan Drugs and specifically, the most recent proposed cuts in Medicare payments and reimbursement provided to hospital outpatient clinics under the Hospital Outpatient Prospective Payment System (HOPPS).

Let me provide a quick refresher on the issue of Orphan Drugs. Orphan drugs (and related products) are treatments for rare disorders; as defined in the Orphan Drug Act of 1983, a rare disorder is a disease or condition affecting fewer than 200,000 Americans. Pharmaceutical companies and research companies spend millions of dollars developing these products under "fast-track approval" guidelines established by the Food and Drug Administration. This is an expedited process developed to get these drugs to market so that patient lives can be saved and the quality of life improved for those people impacted by the rare and disabling conditions.

On August 9, 2002 Medicare proposed a very serious cut in the payment for 2003 for many drugs provided in hospital outpatient clinics. This proposed cut comes on top of another major cut in payments for drugs used in the hospital outpatient setting of care that was just put in place in April of 2002. What does all of this mean and why should caregivers, physicians, allied healthcare professionals, families and those with special needs be concerned about this?

The answer is quite simple: This is a critical access issue for those rare diseases and conditions where injectable and intravenous treatments are currently available and paid for by Medicare. Many existing orphan drugs, including blood products for individuals with hemophilia and also spasticity arising out of central nervous system disorders, such as cerebral palsy, cervical dystonia and other similar conditions, will become less available beginning in January. This pending legislation, if enacted, may make future treatments (and possible cures) inaccessible. Notably at risk might be promising protein and enzyme therapies for certain genetic disorders. Under the proposed Medicare cuts, treatments for rare disorders will be bundled for payment with high-volume, mainstream drugs that cost considerably less; hospital outpatient clinics will be wary of stocking expensive low-volume drugs such as orphan products if they know that they will not be adequately reimbursed. As a result, patients will be denied treatments because healthcare providers may refuse to administer orphan drugs and biologics to Medicare patients with these disorders and conditions.

Such action by Medicare is not only illogical and unsound but it is clearly insensitive to the basic needs of those with special healthcare conditions. Simply put, Congress should ensure that each orphan drug or biologic is considered individually, not as part of some convenient "bundling" approach because their costs vary widely and they cannot be compared to common drugs used for more prevalent conditions.

You can make a difference and you must make a difference! EP joins the National Organization of Rare Diseases (NORD) and supports its task force focused on expanding awareness of the importance of this issue and facilitating action on your part. You can write letters to your congressman and senators. Sample copies are provided on the EP Web Site along with specific addresses where they can be sent. Simply log onto the EP Web site at http://www.eparent.com and click on "Orphan Drugs". And this appeal transcends those who might be impacted directly. All of us are affected by this kind of shortsighted thinking and all of us have an obligation to support each other.

Don't wait. The time for action is now.
